Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX A method, useful for prognosing and treating solid tumor, comprises
XX comparing an expression profile of a gene expressed in peripheral blood
XX mononuclear cells to a reference expression profile of a gene.
XX Disclosure; Page; 111pp; English.

```

XX The invention describes a method comprising comparing an expression
CC profile of at least one gene in a peripheral blood sample of a patient to
CC at least one reference expression profile of the at least one gene, where
CC the patient has a solid tumour, and each of the gene is differentially
CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
CC of patients as compared to PBMCs of a second class of patients, where
CC both the first and second classes of patients have the solid tumour, and
CC each of the first and second classes is a subcluster formed by an
CC unsupervised clustering analysis of gene expression profiles in PBMCs of
CC a population of patients who have the solid tumour, and where the
CC majority of the first class of patients has a first clinical outcome, and
CC the majority of the second class of patients has a second clinical
CC outcome. Also described are: a system comprising (i) a memory or a
CC storage medium including data that represent an expression profile of at
CC least one gene in a peripheral blood sample of a patient who has a solid
CC tumour, (ii) at least another storage medium including data that
CC represent at least one reference expression profile of the gene, (iii) a
CC program capable of comparing the expression profile to the reference
CC expression profile, and (iv) a processor capable of executing the
CC program, where expression levels of the gene in peripheral blood
CC mononuclear cells of patients who have the solid tumour correlate with
CC clinical outcomes of the patients; and a nucleic acid or protein array
CC comprising concentrated probes for solid tumour prognosis genes, where
CC each of the solid tumour prognosis genes is differentially expressed in
CC PBMCs of a first class of patients as compared to PBMCs of a second class
CC of patients, where both the first and second classes of patients have a
CC solid tumour, and where the first class of patients has a first clinical
CC outcome, and the second class of patients has a second clinical outcome.
CC The method, system, and array are useful for prognosing and treating
CC solid tumours. This sequence represents a solid tumour prognosis gene of
CC the invention. Note: The sequence data for this patent did not form part
CC of the printed specification, but was obtained in electronic format
CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
response useful in vaccinating against and in treating tumors.

XX Disclosure; Page 78-79; 79pp; English.

XX The present sequence encodes the canine 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in CC carcinomas but has a highly restricted expression pattern in normal adult CC tissues. It appears to be strongly correlated to metastasis in colorectal CC and gastric cancer. 5T4 antigen may therefore be useful in tumour CC diagnosis, targeting and immunotherapy. Mice in which tumours had been CC induced were inoculated with a virus expression vector containing the CC human or murine 5T4 gene sequence. The 5T4 antigen was shown to be CC effective at eliciting an immunotherapeutic anti-tumour response. Both CC the nucleic acid encoding the antigen and the antigen itself can be used CC to elicit an immune response, preferably CTL or an antibody response in a CC subject

XX Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast cancer nucleic acids.

XX Claim 9; Page 372; 414pp; English.

XX The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the CC diagnosis or prognosis of breast cancer, and for detecting genes that are CC up or down-regulated in breast cancer cells. Genes identified by the CC method of the invention can be used in diagnostic purposes and also as CC targets for screening for therapeutic compounds that modulate breast CC cancer (e.g. hormones or antibodies). Identification of genes that are CC over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of CC diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07693 - ABT07761 CC represent the 69 breast cancer-associated gene sequences of the invention

XX Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the

PT patient with a polynucleotide that exhibits increased or decreased
 XX expression in lung cancer.
 PS Claim 22; Page 336; 453pp; English.
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 PT comprises contacting an assay system comprising a purified leucine rich
 PT repeat, capricious related polypeptide or nucleic acid with a test agent.
 XX
 PS Example 5; Page 74-75; 99pp; English.
 XX
 CC The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

XX New NOVX polypeptides and polynucleotides, useful for preventing,
PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
PT disorders, and asthma.
XX Claim 16; Page 114-115; 619pp; English.
XX The present invention relates to new isolated proteins (NOVX) and their
CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
CC any number from 1 to 48. The NOVX proteins and coding sequences are
CC useful in the manufacture of a medicament for treating a syndrome
CC associated with a human disease, preferably a NOVX-associated disorder.
CC The NOVX coding sequences and proteins are useful for treating,
CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
CC obesity, infectious disease, anorexia, cancer-associated cachexia,
CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
CC disease, immune disorders, haematopoietic disorders, cardiovascular
CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
CC disturbances associated with obesity, metabolic syndrome X or wasting
CC disorders associated with chronic diseases or various cancers. The NOVX
CC coding sequences and proteins may also be used as targets for the
CC identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods

 XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.
 XX
 XX Claim 4; Page 68; 68pp; English.
 XX
 CC The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 5T4 protein

 XX
 CC The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
 CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

XX KW Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX PT response useful in vaccinating against and in treating tumors.
XX PS Example 2; Page 78; 79pp; English.
XX CC The present sequence encodes the human 5T4 tumour-associated antigen
XX CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX CC carcinomas but has a highly restricted expression pattern in normal adult
XX CC tissues. It appears to be strongly correlated to metastasis in colorectal
XX CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX CC induced were inoculated with a virus expression vector containing the
XX CC present sequence. The 5T4 antigen was shown to be effective at eliciting
XX CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
XX CC the antigen and the antigen itself can be used to elicit an immune
XX CC response, preferably CTL or an antibody response in a subject

 XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 XX polypeptide, useful in preparation of vaccine for treating and/or
 XX preventing cancer in a subject, preferably a dog or cat.
 XX Claim 1; Page 67; 68pp; English.
 XX The present invention relates to the isolation of canine and feline
 XX oncofoetal leucine-rich glycoproteins known as 5T4, and the
 XX polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 XX a significant proportion of tumours. The sequences of the invention are
 XX useful in a pharmaceutical composition for the prevention and/or
 XX treatment of tumours or other diseases associated with cell
 XX proliferation, infections, and inflammatory conditions in animals,
 XX preferably dogs or cats. The compositions may also be used for cancer
 XX immunotherapy in these animals. The sequences of the invention may also
 XX be used in diagnostic kits for rapid, reliable, sensitive, and specific
 XX measurement and localisation of 5T4 in extracts of plasma, urine,
 XX tissues, and in cell culture media. Antibodies specific for the 5T4
 XX protein are useful for isolating foetal cells from maternal blood. The
 XX isolation process may form part of a diagnostic method e.g. the foetal
 XX cells may then be subject to biochemical or genetic sampling e.g. the
 XX testing foetal abnormalities, or to determine the sex of the foetus(es).
 XX The present sequence encodes canine 5T4 protein

XX
XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
PT response useful in vaccinating against and in treating tumors.
XX
XX Example 2; Page 78; 79pp; English.
XX
XX The present sequence encodes the mouse 5T4 tumour-associated antigen
CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject. The
CC present sequence appears in GenBank at accession number AJ012160

XX
XX Identifying a candidate p53 pathway-modulating agent for treating cancer
PT comprises contacting an assay system comprising a purified leucine rich
PT repeat, capricious related polypeptide or nucleic acid with a test agent.
XX
XX Disclosure; Page 75-76; 99pp; English.
XX
XX The invention relates to a method of identifying a candidate p53 pathway
CC modulating agent. The method involves contacting an assay system
CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
CC polypeptide or nucleic acid or its fragment with a test agent and
CC detecting a test agent-biased activity, where a difference between the
CC test agent-biased activity and the reference activity identifies the test
CC agent as a candidate p53 pathway modulating agent. The method is useful
CC for identifying a candidate p53 pathway-modulating agent for preparing a
CC composition for diagnosing or treating cancer. The invention is useful in
CC gene therapy. The present sequence is human LRRCAPS related DNA

XX
XX New genes regulated by MYCN activation, useful in gene therapy,
PT particularly for treating a subject with e.g. neuroblastoma or other
PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.
XX
XX Claim 1; SEQ ID NO 105; 27pp; English.
XX
XX This invention relates to novel isolated cDNAs that are differentially
CC expressed in MYCN activated cells. Specifically, it refers to
CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an
CC exemplification of the invention. NOTE: This sequence does not appear in
CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009.

XX Detecting a bladder cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT bladder cancer-associated polynucleotide or antibody.
XX
XX Claim 6; Page 296; 307pp; English.
XX
XX The present invention describes a method for detecting a bladder cancer-
CC associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC table of sequences (see ACCS0951 to ACCS1059). ACCS0951 to ACCS1059
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
CC have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC The nucleic acid molecules from the present invention may be used in
CC various screening and diagnostic methods, and for gene therapy, vaccine
CC and/or antisense/inhibition applications

 PT Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 335; 453pp; English.
 XX
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

 XX New antibody that binds to a tumor-associated antigenic target (TAT)
 PT polypeptide, useful for preparing a composition for diagnosing or
 PT treating cancer.
 XX Claim 1; SEQ ID NO 53; 319pp; English.
 XX The present invention relates to the isolation of human tumour-associated
 CC antigenic target (TAT) polynucleotide and polypeptide sequences. Also
 CC disclosed is an antibody that binds to a TAT polypeptide. The antibody is
 CC a monoclonal antibody, an antibody fragment, a chimeric antibody or a
 CC humanised antibody. It is conjugated to a growth inhibitory agent. It is
 CC produced in bacteria or in CHO cells and induces death of a cell to which
 CC it binds. The antibody is useful for preparing a composition for
 CC diagnosing or treating tumours and cancer. The present sequence
 CC represents a human TAT cDNA sequence of the invention.

 PT determining the similarity between the level of expression of each of

PT five genes in a cell sample taken from patient, to control levels.
 XX Disclosure; SEQ ID NO 1305; 226pp; English.
 CC
 CC The invention relates to a method of classifying a breast cancer patient
 CC according to prognosis by determining the similarity between the level of
 CC expression of each of five genes for which markers are listed in the
 CC specification, in a cell sample taken from the breast cancer patient, to
 CC control levels of expression for each respective five genes to obtain a
 CC patient similarity value. The methods are useful for classifying a breast
 CC cancer patient according to prognosis. Kits and computer program products
 CC are useful for data analysis using the diagnostic, prognostic and
 CC statistical methods of the invention. This sequence corresponds to a
 CC marker used in the method of the invention.

 XX Claim 1; SEQ ID NO 2070; 7273pp; English.

CC The invention relates to human tumour-associated antigenic target (TAT)
 CC polypeptides, and their related nucleic acids. The TAT polypeptides are
 CC overexpressed in cancer tissues compared to normal tissues, and may thus
 CC serve as effective targets for the diagnosis and treatment of cancer in
 CC mammals. The invention also relates to nucleic acid and polypeptide
 CC sequences at least 80% identical to the TAT nucleic acids and
 CC polypeptides; expression vectors and host cells comprising a TAT nucleic
 CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
 CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
 CC TAT polypeptide; and methods and compositions for the treatment or
 CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
 CC antibodies, antagonists, binding molecules and compositions are useful
 CC for diagnosing or treating a cell proliferative disorder associated with
 CC increased TAT expression, particularly cancers such as breast cancer,
 CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
 CC cancer, pancreatic cancer, cervical cancer, cancers of the central
 CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
 CC used as hybridisation probes, in chromosome and gene mapping, in
 CC chromosome identification and in gene therapy. The present sequence
 CC represents a TAT nucleic acid of the invention

XX Identifying a compound that can treat disease or disorders, such as, a
PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
PT determining the expression of one or more efficacy genes in a cell
PT contacted with the test compound.
XX
XX Example 6; SEQ ID NO 174; 39pp; English.
XX
CC This invention relates to a novel screening method identified as a multi-
CC parameter high throughput screening (MPTS) assay. Specifically, it
CC refers to an assay that utilizes the disease signature of a plurality of
CC specific genes associated with a particular disease, and identifies
CC differential expression between those cells taken from individuals
CC affected by that disease and those that are not affected. The present
CC invention then describes the screening of candidate pharmaceutical
CC compounds to identify those that have a potential therapeutic benefit for
CC the treatment of neuropsychiatric and neurodegenerative disorders
CC including schizophrenia, bipolar affective disorder (BAD) and autism, as
CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
CC of this invention exhibit various activities including neuroleptic,
CC nootropic, antimanic and antidepressant. Furthermore, the screening
CC method used in MPTS will be automated, such that a large number of test
CC compounds may be rapidly screened with a minimal amount of labour and
CC effort. This polynucleotide is a human cDNA sequence of a gene that is
CC differentially expressed in the presence of a therapeutic compound and
CC represents an exemplary efficacy gene for bipolar affective disorder,
CC given in an exemplification of the invention.

XX
XX Claim 1; SEQ ID NO 22979; 103pp; English.
PS
CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC sequences. (I) is useful as hybridisation probes, polymerase chain
CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC and in recombinant production of (II). The polynucleotides are also used
CC in diagnostics as expressed sequence tags for identifying expressed
CC genes. (I) is useful in gene therapy techniques to restore normal
CC activity of (II) or to treat disease states involving (II). (II) is
CC useful for generating antibodies against it, detecting or quantitating a
CC polypeptide in tissue, as molecular weight markers and as a food
CC supplement. (II) and its binding partners are useful in medical imaging
CC of sites expressing (II). (I) and (II) are useful for treating disorders
CC involving aberrant protein expression or biological activity. The
CC polypeptide and polynucleotide sequences have application in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC coding sequences of the invention. Note: The sequence data for this
CC patent did not appear in the printed specification, but was obtained in
CC electronic format directly from WIPO at

XX New signal transducer and activator of transcription 6 activation promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g. diabetes and cancer.

XX Claim 4; SEQ ID NO 127; 1368pp; English.

XX The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is

useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention of Th1 hyperactive diseases. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has effectively promoting STAT6 activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive activation or inhibition of STAT6. The present sequence represents a human cDNA encoding a protein which promotes STAT6 activation.

XX New oligonucleotide primers (830 cDNAs) useful for synthesizing full length human cDNAs.

XX Example 1; SEQ ID NO 2866; 1340pp; English.

XX This invention relates to a novel primers useful for synthesizing full

CC length cDNA molecules that encode human proteins. Specifically, it refers

CC to secretory or membrane proteins that are potential therapeutic agents/

CC target molecules in the field of medicine, and in particular genes

CC encoding proteins that are associated with signal transduction,

CC glycoproteins and transcription. The present invention describes a method

CC for efficiently cloning a full length human cDNA from both the 5' and 3'

CC ends using the oligo-capping method. This polynucleotide sequence is a

CC full length human cDNA clone of the invention.

XX
XX Claim 1; SEQ ID NO 283; 291pp; English.
XX
XX The invention describes a new first nucleic acid molecule comprising a
XX polynucleotide sequence given in the specification. Also described are:
XX an animal injected with the nucleic acid molecule; a second nucleic acid
XX molecule comprising a second polynucleotide sequence that is at least
XX about 70, 80, 90 or 95% homologous to the first nucleic acid molecule or
XX that hybridises to the first polynucleotide sequence under high
XX stringency conditions; a vector comprising the nucleic acid molecule and
XX a promoter that drives the expression of the nucleic acid molecule; a
XX host cell transfected, transduced or infected with the nucleic acid molecule;
XX a nucleic acid molecule; a nucleic acid composition comprising a carrier or
XX a buffer and one or more compositions comprising the nucleic acid
XX molecule, vector or host cell; a substantially purified polypeptide; an
XX animal injected with the polypeptide; a polypeptide composition
XX comprising the polypeptide molecule and a carrier or buffer; a cell
XX culture medium comprising the polypeptide or transfected cells
XX transfected with the polynucleotide; making a transfected, transfected,
XX transduced, or infected host cell; synthesising Nanodiscs simultaneously
XX and for synthesising a series of simultaneously-synthesised Nanodiscs
XX sequentially utilising a dynamic system; preparing a hydrophobic protein
XX for determination of crystal structure; immunising a non-human animal;
XX screening for modulators of hydrophobic protein activity; a diagnostic
XX kit; determining the presence of the nucleic acid molecule or its
XX complement; determining the presence of an antibody to the polypeptide in
XX a sample; an antibody specifically recognising, binding to or modulating
XX the biological activity of at least one polypeptide encoded by a nucleic
XX acid molecule or its biologically active fragment; an antibody
XX composition comprising the antibody and a carrier; a bacteriophage, where
XX the antibody is displayed on the bacteriophage; a bacterial cell
XX comprising the bacteriophage; a non-human animal injected with the

CC antibody composition; a host cell that secretes the antibody; making an
CC antibody; diagnosing a disease, disorder, syndrome, or condition
CC comprising cancer, or proliferative, inflammatory, immune, metabolic,
CC bone, CNS, genetic, bacterial and viral diseases, disorders, syndromes or
CC conditions in a patient; a modulator composition comprising a modulator
CC and a carrier; gene therapy; prophylactic or therapeutic treatment of a
CC subject; an isolated modified cell comprising at least one first
CC heterologous nucleic acid molecule, where the first heterologous nucleic
CC acid molecule comprises a first polynucleotide sequence that encodes a
CC first polypeptide; a non-human animal deficient in the polypeptide or
CC that over-expresses the polypeptide; isolated tissues derived from the
CC non-human animal; and one or more cells derived from the non-human
CC animal. The nucleic acid is useful in preparing a composition for
CC diagnosing or treating e.g., cancer, psoriasis or ulcerative colitis.

XX
XX Claim 1; SEQ ID NO 30152; 21pp + Sequence Listing; English.
XX
XX The invention relates to an isolated nucleic acid detection reagent
XX capable of detecting 1000 or more genes from Drosophila. The invention is
XX useful in developmental biology and in elucidating cell signalling and
XX cell-cell interactions in higher eukaryotes for the development of

CC insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (AB116176-AB130511), expressed DNA sequences (AB101840-AB116175) and the encoded proteins (ABBS57737-ABBS72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX PT New isolated G-protein coupled receptor useful for identifying modulators as potential insecticides, to determine the biological activity of the protein and for identifying compounds that modulate receptor activity.

XX PS Claim 4; SEQ ID NO 64; 130pp; English.

XX CC The invention describes an isolated protein (I) consisting or comprising an amino acid sequence selected from fully defined 66 G-protein coupled receptor amino acid sequences (S1), as given in the specification, an allelic variant of (S1), an orthologue of (S1) or fragment of (S1). (I) is useful for identifying an agent that binds to (I) which comprises contacting the protein with an agent and assaying the contacted mixture to determine whether a complex is formed with the agent bound to the protein. (I) is useful for identifying modulators as potential insecticides, to determine the biological activity of the protein (a panel of multiple proteins for high-throughput screening), as targets for identifying agents for use in human drugs and for identifying compounds that modulate receptor activity. An antibody (II) that selectively binds to (I) is useful for assessing normal and aberrant subcellular localisation of cells and monitoring a treatment modality. A nucleic acid (III) encoding (I) is useful for drug/insecticide screening to identify compounds that modulate G-protein coupled receptor (GPCR) nucleic acid expression, diagnostic assays for qualitative changes in GPCR nucleic acid that lead to insecticidal activity/tolerance, to detect mutations in GPCR genes and gene expression products such as mRNA, and as hybridisation probes for determining the presence, level, form and distribution of nucleic acid expression. A host cell comprising a vector

PT
XX Claim 16; SEQ ID NO 744; 182pp; English.
PS
XX The invention relates to cancer-associated proteins (CAP) and the cancer-
CC associated (CA) nucleic acids encoding them. The invention also relates
CC to a method for treating cancers involving administering to a patient an
CC inhibitor of CAP, and a method of screening for anticancer activity in a
CC potential drug involving providing a cell that expresses a CA gene,
CC contacting a tissue sample derived from a cancer cell with an anticancer
CC drug candidate and monitoring the effect of the anticancer drug candidate
CC on expression of the CA gene. The CAP proteins are useful for detecting
CC cancer associated with expression of a CAP protein in a test cell sample
CC and for screening for a bioactive agent capable of modulating the
CC activity of a CAP protein. The CA nucleic acids are useful for diagnosing
CC cancer, involving determining the expression of a CA nucleic acid in a
CC tissue. This sequence represents a human CA gene of the invention. Note:
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

PT level of expression of genes or gene products in a biological sample from
PT the patient with that from a normal individual.
XX
XX Claim 2; SEQ ID NO 278; 60pp; English.
PS
XX The invention relates to providing a patient diagnosis for lung cancer
CC comprising comparing the level of expression of genes or gene products in
CC a biological sample from the patient with the level of expression of
CC genes or gene products in a biological sample from a normal individual.
CC Also included are distinguishing between normal and disease tissues,
CC monitoring the response of a patient being treated for lung cancer by
CC administering an anti-cancer agent, identifying a compound useful for the
CC treatment of lung cancer and an array for distinguishing between normal
CC and disease tissues (comprising 2 or more probes corresponding to 2 or
CC more genes selected from any of the 200 nucleotide sequences given in the
CC specification, or 2 or more polypeptides comprising any of the 200 amino
CC acid sequences given in the specification). In providing a patient
CC diagnosis for lung cancer, one or more genes are selected from any of the
CC 200 nucleotide sequences as mentioned in the specification, or one or
CC more gene products are polypeptides selected from any of the 20 amino
CC acid sequences mentioned in the specification. The methods are useful for
CC detecting and treating lung cancer. These may also be used for designing,
CC identifying and optimizing therapeutics for cancer. The present sequence
CC represents a cDNA from one of the 200 lung cancer marker genes. Note: The
CC sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

 XX
 PS Claim 1; Page 119-200; 223pp; English.
 XX
 CC The invention relates to a nucleic acid comprising a polymorphic region
 CC of a Calcium/calmodulin-dependent protein kinase-like gene (CADPKL)
 CC allelic variant, and the polypeptide it encodes. CADPKL allelic variants
 CC are useful in determining whether a subject has or is at risk of
 CC developing a neuropsychiatric disorder, such as schizophrenia, attention
 CC deficit disorder (ADD), schizoaffective disorder, bipolar disorder,
 CC unipolar affective disorder and adolescent conduct disorder. The
 CC polypeptides, polynucleotides, antibodies and modulators of the CADPKL
 CC allelic variants are useful for diagnosing or treating these
 CC neuropsychiatric disorders. The polypeptides may be used to raise
 CC antibodies to a CADPKL polypeptide. The nucleic acids may be used as
 CC probes or primers, in pharmacogenomics for designing therapies for the
 CC disorders, and in fingerprinting for detection of different individuals
 CC with the same species (e.g. paternity testing). This sequence represents
 CC human CADPKL genomic DNA of the invention

 PT Monitoring differential expression of several genes in first Bacillus
 PT cell relative to expression of same genes in one or more second Bacillus
 PT cells, by using substrate containing Bacillus genomic sequenced tag
 PT array.
 XX
 PS Claim 4; SEQ ID NO 2800; 200pp; English.
 XX
 CC The invention describes a method of monitoring differential expression of
 CC genes in a first Bacillus cell relative to expression of the genes in
 CC other Bacillus cells, comprising hybridising labelled nucleic acid probes
 CC isolated from Bacillus cells to a substrate containing array of Bacillus
 CC genomic sequenced tags (GST), examining the array, and determining
 CC relative gene expression by an observed hybridisation reporter signal of
 CC a spot in the array. The method is useful for measuring the expression of
 CC genes in a first Bacillus cell relative to expression of the same genes
 CC in one or more second Bacillus cells. The method is useful for monitoring
 CC global expression of several genes from a Bacillus cell, discovering new
 CC genes, identifying possible functions of unknown open reading frames and
 CC monitoring gene copy number variation and stability. Monitoring changes
 CC in expression of genes may be used to provide a representation of the way
 CC in which Bacillus cells adapt to changes in culture conditions,
 CC environmental stress or other physiological provocation. Extensive follow
 CC up characterisation is unnecessary, when one spot on an array equals one
 CC gene or one open reading frame, since sequence information is available.
 CC This sequence represents a genomic sequence tag (GST) used in the method
 CC of the invention. Note: The sequence data for this patent did not form
 CC part of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 XX
 XX Determining the degree of cytosine methylation in genomic DNA, useful for
 PT diagnosis and prognosis, comprises selective hybridization of amplicons
 PT from chemically treated DNA.
 XX
 XX Claim 12; 56pp + Sequence Listing; 56pp; German.
 XX
 XX This invention describes a novel method for determining the degree of
 CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a
 CC genomic sample of DNA. The sample is treated chemically to convert
 CC cytosine (C) but not methylated C, to uracil, then part of the genomic
 CC DNA that contains the target C is amplified to form a labeled amplicon.
 CC The amplicon is hybridised to two classes, each with at least one member,
 CC of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the
 CC degree of hybridisation to both classes is determined from the label on
 CC the amplicon. From the ratio of labels hybridised to the two classes of
 CC oligomers, the degree of methylation is calculated. The method is used:
 CC (i) for diagnosis and/or prognosis of side effects of therapeutic drugs
 CC and of a wide range of diseases, e.g. cancer, disorders of the central
 CC nervous, cardiovascular, gastrointestinal and respiratory systems etc.,
 CC particularly by detecting mutations or single nucleotide polymorphisms
 CC (SNP's); and (ii) for differentiation of cell or tissue types and for
 CC investigating cell differentiation. The method allows the methylation
 CC status of many C residues to be determined simultaneously. ABQ13410-
 CC ABQ54121 represent genomic DNA sequences used to illustrate the method
 CC for determining the degree of cytosine methylation described in the
 CC disclosure of the invention

TITLE

JOURNAL Submitted (03-NOV-2004) Sanger Institute, Hinxton, Cambridgeshire,
 CB10 1SA, UK. E-mail enquiries: tropesanger.ac.uk

COMMENT

This sequence is from a Xenopus Gene Collection (XGC) library, from
 a library constructed by Aaron M. Zorn. cDNA was prepared from RNA
 extracted from gastrula embryos. EcoRI-NotI cut cDNA was then
 ligated into pCS107 with EcoRI at the 5' end and NotI at the 3'
 end.

Vector: pCS107; Site 1: EcoRI; Site 2: NotI

Host: Escherichia coli XL1-blue.

Clone distribution: MGC clone distribution information can be found
through the I.M.A.G.E. Consortium/ILNL at: http://image.llnl.gov
Series: IRAC Plate: 123 Row: p Column: 18
This clone was selected for full length sequencing because it
passed the following selection criteria: matched mRNA gi: 6755854.

 The international consortium for macaque cDNA sequencing and analysis consists of: Department of Virology and Human Genome Center, Institute of Medical Science, The University of Tokyo, Tokyo, Japan; Division of Genetic Resources, National Institute of Infectious Diseases of Japan, Tokyo, Japan; National Health Research Institute, Taipei, Taiwan; Institute of Molecular Biology, Academia Sinica, Taipei, Taiwan; Department of Ecology & Evolution, University of Chicago, Chicago, IL, USA; Center for Information Biology, National Institute of Genetics of Japan, Mishima, Japan.
 Clone distribution: clone distribution information can be found at: <http://www.nih.go.jp/yoken/genebank/>

Lab host: pME10
 Vector: pME18S-FL3 (Acc.NO. AB009864)

R. Site1: DraIII (CAGCTGTG)
 R. Site2: DraIII (CAGCATGTG)

Description: 1st strand cDNA was primed with an oligo(dT) primer using specific 5' and 3' primers and amplified by PCR. The PCR product was digested with SfiI and size selection was performed to exclude fragments <1.5kb. The SfiI-digested PCR product was cloned into distinct DraIII sites of pME18S-FL3. XhoI sites just outside the DraIII sites can be used to isolate the cDNA insert. Libraries were constructed by oligo-capping method. Libraries were made from:

QccB: cerebellum cortex
 QnpA: parietal lobe
 QtrA: temporal lobe right
 QflA: frontal lobe left
 QmoA: medulla oblongata
 QbsA: brain stem
 QorA: occipital lobe right
 QtsA: testis

Custom primers were used for 5' and 3'-end sequencing. The full-insert sequencing was done by primer-walking method using ABI DNA sequencer.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

----- Summary Statistics
Center project name: M_BB0511A23
Drafting center: WIBR

NOTICE:

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e. phred quality >=30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest.

Rat Genome Sequencing Consortium.

Direct Submission

Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 20, 2002 this sequence version replaced gi:22857070.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas

(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described

in the feature table below represents a scaffold in the Atlas

COMMENT

assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Summary Statistics

Center project name: M_BB0149D09

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:

The RPCI-24 BAC library has been constructed by Pieter de Jong and coworkers (<http://www.chori.org>) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at <http://www.chori.org>

NEIGHBORING SEQUENCE INFORMATION:

This sequence is the entire insert of the clone. This clone is overlapped by AC122337

----- Project Information

Center project name: L10494

Center clone name: 124_C_9

* NOTE: This record contains 82 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will
 * be preserved.

Web site: http://genome.imb-jena.de/
Contact: gscj-submit@genome.imb-jena.de
----- Project Information
Center project name: H269
Center clone name: CTC-790L10
----- Summary Statistics
Sequencing vector: pUC18; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 110433 bases at least Q40
Consensus quality: 110887 bases at least Q30
Consensus quality: 111058 bases at least Q20
Quality coverage: 9.56x.

-----
This sequence was finished as follows unless otherwise noted: all
regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one pUC18 subclone; and the
assembly was confirmed by restriction digest

-----
Sequence Quality Assessment:
This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the
Genbank flat file format but are available as part
of this entry's ASN.1 file.

COMMENT

On Jul 31, 2004 this sequence version replaced gi:13324738.

Sequence submitted by:

Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley, CA 94720

This sequence submission incorporates changes made during reevaluation of the assembly or fingerprint verification of the clone. For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive web site (<http://www.fruitfly.org/sequence/>) or send email to bdgp@fruitfly.org.

----- Summary Statistics
Sequencing vector: M13; M7815; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 172439 bases at least Q40
Consensus quality: 174228 bases at least Q30
Consensus quality: 174815 bases at least Q20
Insert size: 174000; agarose-fp
Insert size: 175337; sum-of-contigs
Quality coverage: 5.9 in Q20 bases; agarose-fp
Quality coverage: 5.8 in Q20 bases; sum-of-contigs

* NOTE: This is a 'working draft' sequence. It currently
* consists of 6 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
* 1 5925: contig of 5925 bp in length
* 5926 6025: gap of 100 bp
* 6026 21447: contig of 15422 bp in length
* 21448 21547: gap of 100 bp
* 21548 50643: contig of 29096 bp in length
* 50644 50743: gap of 100 bp
* 50744 81519: contig of 30776 bp in length
* 81520 81620: gap of 100 bp
* 81620 127107: contig of 45488 bp in length
* 127108 127207: gap of 100 bp
* 127208 175837: contig of 48630 bp in length.

 DR Detecting a breast cancer-associated transcript in a patient's cell,
 DR useful for diagnosing breast cancer, comprises contacting a biological
 DR sample with a polynucleotide that selectively hybridizes with breast
 DR cancer nucleic acids.
 XX Claim 9; Page 372; 414pp; English.
 PS The invention comprises a method of detecting a breast cancer-associated
 XX transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridizes to one of the 69 breast cancer-associated gene sequences shown
 CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

XX PT Detecting a lung cancer-associated transcript in a cell from a patient
PT patient with a polynucleotide that exhibits increased or decreased
PT expression in lung cancer.
XX PS Claim 22; Page 336; 453pp; English.
XX CC The invention relates to a method for detecting a lung cancer-associated
CC transcript in a cell from a patient, comprising contacting a biological
CC sample from the patient with a polynucleotide that selectively hybridizes
CC to a sequence that is at least 80% identical to a gene that exhibits
CC increased or decreased expression in lung cancer samples. Lung cancer-
CC associated polynucleotides and polypeptides are used for identifying a
CC compound that modulates a lung cancer-associated polypeptide, for
CC inhibiting proliferation of a lung cancer-associated cell to treat lung
CC cancer in a patient and for treating a mammal having lung cancer by
CC administering a modulatory compound identified. The methods are useful
CC for treating lung cancer, such as small cell lung cancer, non-small cell
CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
CC for diagnostic purposes and as targets for screening for therapeutic
CC compounds that modulate lung cancer, such as antibodies. Sequences
CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
CC invention

XX PT Detecting an ovarian cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT polynucleotide that hybridizes to an ovarian cancer gene.
XX PS Claim 10; Page 297; 332pp; English.
XX CC The invention relates to a method of detecting an ovarian cancer-
CC associated transcript in a cell from a patient, by contacting a
CC biological sample from the patient with a polynucleotide that selectively
CC hybridizes to a sequence at least 80% identical to any of one of 80
CC nucleic acid sequences given in the specification. The method is useful
CC in diagnosing ovarian cancer and in identifying and using agents and/or
CC targets that inhibit ovarian cancer. The nucleic acid molecule,
CC polypeptide and the antibody may also be used in detecting ovarian
CC cancer, monitoring and early detection of relapse following treatment,
CC monitoring response to therapy, selecting patients for post-operative
CC chemotherapy or radiation therapy, in selection of mode of therapy,
CC determining tumour prognosis, early detection of pre-cancerous lesions,
CC and as vaccines. This sequence corresponds to one of the nucleic acids
CC used for the detection method of the invention.

XX Determining the presence or absence of a pathological cell in a patient,
XX useful for diagnosing, prognosing or treating cancer, comprises detecting
XX a nucleic acid in a biological sample.
XX
XX Claim 8; SEQ ID NO 41; 1385pp; English.
XX
XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
XX whose expression is upregulated or downregulated in specific cancers or
XX other diseases such as angiogenic or fibrotic disorders, and to methods
XX of determining the presence or absence of a pathological cell in a
XX patient by detecting a nucleic acid at least 80% identical to those of
XX the invention or by detecting a polypeptide of the invention. The
XX invention also relates to expression vectors and host cells comprising a
XX nucleic acid of the invention; antibodies which specifically bind a
XX polypeptide of the invention; use of such antibodies for drug targeting;
XX and methods of screening for modulators of activity or expression of the
XX polypeptides and nucleic acids. The nucleic acids, polypeptides,
XX antibodies and methods are useful for diagnosing, prognosing and treating
XX cancer and other conditions such as psoriasis, ischaemia, heart disease,
XX atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
XX neovascularisation syndromes, scarring and uterine fibroids. They may
XX also be useful in wound healing and in contraception. The present
XX sequence represents a nucleic acid sequence of the invention.

XX
XX New NOVX polypeptides and polynucleotides, useful for preventing,
PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
PT disorders, and asthma.
XX
XX Claim 16; Page 114-115; 619pp; English.
XX
XX The present invention relates to new isolated proteins (NOVX) and their
CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
CC any number from 1 to 48. The NOVX proteins and coding sequences are
CC useful in the manufacture of a medicament for treating a syndrome
CC associated with a human disease, preferably a NOVX-associated disorder.
CC The NOVX coding sequences and proteins are useful for treating,
CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
CC obesity, infectious disease, anorexia, cancer-associated cachexia,
CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
CC disease, immune disorders, haematopoietic disorders, cardiovascular
CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
CC disturbances associated with obesity, metabolic syndrome X or wasting
CC disorders associated with chronic diseases or various cancers. The NOVX
CC coding sequences and proteins may also be used as targets for the
CC identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods

Xx Tumour associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
Xx response useful in vaccinating against and in treating tumors.
Xx Example 2; Page 78; 79pp; English.
Xx The present sequence encodes the human 5T4 tumour-associated antigen
Xx ('TAA'). The TAA 5T4 is a glycoprotein which is widely expressed in
Xx carcinomas but has a highly restricted expression pattern in normal adult
Xx tissues. It appears to be strongly correlated to metastasis in colorectal
Xx and gastric cancer. 5T4 antigen may therefore be useful in tumour
Xx diagnosis, targeting and immunotherapy. Mice in which tumours had been
Xx induced were inoculated with a virus expression vector containing the
Xx present sequence. The 5T4 antigen was shown to be effective at eliciting
Xx an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
Xx the antigen and the antigen itself can be used to elicit an immune
Xx response, preferably CTL or an antibody response in a subject

Xx Use of single chain antibody capable of recognizing a disease associated
Xx molecule for manufacturing a medicament for preventing and/or treating a
Xx disease condition associated with disease associated molecule.
Xx Disclosure; Fig 26; 118pp; English.
Xx The specification describes the use of a single chain antibody (ScFv),
Xx which is capable of recognizing a disease associated molecule in the
Xx manufacture of a medicament for the prevention and treatment of a disease
Xx condition. The ScFv antibody is useful in the manufacture of a
Xx medicament, for affecting a disease in vivo, for preparing a
Xx pharmaceutical composition, for in vivo imaging and/or for adjuvant
Xx treatment of a disease. The ScFv antibody is also useful for treating
Xx inflammatory diseases including arthritis, hypersensitivity, autoimmune
Xx diseases, cancers, central nervous system disorders including Parkinson's
Xx disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
Xx diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
Xx related diseases, and other immune disorders. The present sequence
Xx encodes a 5T4 protein, which is used to produce ScFv of the invention

XX
XX New genes regulated by MYCN activation, useful in gene therapy,
PT particularly for treating a subject with e.g. neuroblastoma or other
PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.
XX
XX Claim 1; SEQ ID NO 105; 27pp; English.
PS
XX This invention relates to novel isolated cDNAs that are differentially
XX expressed in MYCN activated cells. Specifically, it refers to
CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an
CC exemplification of the invention. NOTE: This sequence does not appear in
CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.seqdata.uspto.gov/sequence.html?docID=20030119009.

PT bladder cancer-associated polynucleotide or antibody.
XX
XX Claim 6; Page 296; 307pp; English.
PS
XX The present invention describes a method for detecting a bladder cancer-
XX associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC table of sequences (see ACCS0951 to ACCS1059). ACCS0951 to ACCS1059
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
CC have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC The nucleic acid molecules from the present invention may be used in
CC various screening and diagnostic methods, and for gene therapy, vaccine
CC and/or antisense/inhibition applications

XX Detecting a lung cancer-associated transcript in a cell from a patient

XX for treating lung cancer, by contacting a biological sample from the

XX patient with a polynucleotide that exhibits increased or decreased

XX expression in lung cancer.

XX Claim 22; Page 335; 453pp; English.

XX The invention relates to a method for detecting a lung cancer-associated

XX transcript in a cell from a patient, comprising contacting a biological

XX sample from the patient with a polynucleotide that selectively hybridizes

XX to a sequence that is at least 80 % identical to a gene that exhibits

XX increased or decreased expression in lung cancer samples. Lung cancer-

XX associated polynucleotides and polypeptides are used for identifying a

XX compound that modulates a lung cancer-associated polypeptide, for

XX inhibiting proliferation of a lung cancer-associated cell to treat lung

XX cancer in a patient and for treating a mammal having lung cancer by

XX administering a modulatory compound identified. The methods are useful

XX for treating lung cancer, such as small cell lung cancer, non-small cell

XX lung cancer or other benign or precancerous lesions, e.g. atelectasis,

XX emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,

XX hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and

XX bronchiectasis. The genes, polynucleotides and polypeptides are useful

XX for diagnostic purposes and as targets for screening for therapeutic

XX compounds that modulate lung cancer, such as antibodies. Sequences

XX CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the

XX invention

XX XX
CC The invention relates to human tumour-associated antigenic target (TAT)
CC polypeptides, and their related nucleic acids. The TAT polypeptides are
CC overexpressed in cancer tissues compared to normal tissues, and may thus
CC serve as effective targets for the diagnosis and treatment of cancer in
CC mammals. The invention also relates to nucleic acid and polypeptide
CC sequences at least 80% identical to the TAT nucleic acids and
CC polypeptides; expression vectors and host cells comprising a TAT nucleic
CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
CC TAT polypeptide; and methods and compositions for the treatment or
CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
CC antibodies, antagonists, binding molecules and compositions are useful
CC for diagnosing or treating a cell proliferative disorder associated with
CC increased TAT expression, particularly cancers such as breast cancer,
CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
CC cancer, pancreatic cancer, cervical cancer, cancers of the central
CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
CC used as hybridisation probes, in chromosome and gene mapping, in
CC chromosome identification and in gene therapy. The present sequence
CC represents a TAT nucleic acid of the invention

 XX PT Identifying a compound that can treat disease or disorders, such as, a
 PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
 PT determining the expression of one or more efficacy genes in a cell
 PT contacted with the test compound.
 XX PS Example 6; SEQ ID NO 174; 39pp; English.
 XX CC This invention relates to a novel screening method identified as a multi-
 CC parameter high throughput screening (MPHTS) assay. Specifically, it
 CC refers to an assay that utilizes the disease signature of a plurality of
 CC specific genes associated with a particular disease, and identifies
 CC differential expression between those cells taken from individuals
 CC affected by that disease and those that are not affected. The present
 CC invention then describes the screening of candidate pharmaceutical
 CC compounds to identify those that have a potential therapeutic benefit for
 CC the treatment of neuropsychiatric and neurodegenerative disorders
 CC including schizophrenia, bipolar affective disorder (BAD) and autism, as
 CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
 CC of this invention exhibit various activities including neuroleptic,
 CC neurotropic, antianemic and antidepressant. Furthermore, the screening
 CC method used in MPHTS will be automated, such that a large number of test
 CC compounds may be rapidly screened with a minimal amount of labour and
 CC effort. This polynucleotide is a human cDNA sequence of a gene that is
 CC differentially expressed in the presence of a therapeutic compound and
 CC represents an exemplary efficacy gene for bipolar affective disorder,
 CC given in an exemplification of the invention.

 XX PT New isolated polynucleotide and encoded polypeptides, useful in
 PT diagnostics, forensics, gene mapping, identification of mutations
 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.
 XX PS Claim 1; SEQ ID NO 22979; 103pp; English.
 XX CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (I) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have applications in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits to assess biodiversity
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AA594564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in

 XX Claim 4; SEQ ID NO 127; 1368pp; English.
 XX
 CC The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

 XX CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 XX CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 XX CC a significant proportion of tumours. The sequences of the invention are
 XX CC useful in a pharmaceutical composition for the prevention and/or
 XX CC treatment of tumours or other diseases associated with cell
 XX CC proliferation, infections, and inflammatory conditions in animals,
 XX CC preferably dogs or cats. The compositions may also be used for cancer
 XX CC immunotherapy in these animals. The sequences of the invention may also
 XX CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 XX CC measurement and localisation of 5T4 in extracts of plasma, urine,
 XX CC tissues, and in cell culture media. Antibodies specific for the 5T4
 XX CC protein are useful for isolating foetal cells from maternal blood. The
 XX CC isolation process may form part of a diagnostic method e.g. the foetal
 XX CC cells may then be subject to biochemical or genetic sampling used for
 XX CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 XX CC The present sequence encodes feline 5T4 protein

XX PT New major histocompatibility complex class I peptide epitopes from human
XX PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
XX PT disease, particularly cancer.
XX PS Disclosure; Page 67; 73pp; English.
XX CC The invention relates to a novel Major Histocompatibility Complex (MHC)
XX CC class I peptide epitope of the 5T4 antigen. The invention further
XX CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
XX CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
XX CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
XX CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
XX CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
XX CC comprising the above; a method for treating and/or preventing a disease
XX CC in a subject by administering the vaccine; an agent capable of binding
XX CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
XX CC comprising detecting the presence of the 5T4 epitope or its encoding
XX CC nucleic acid in a subject; and a T cell line or clone capable of
XX CC specifically recognising the 5T4 epitope in conjunction with an MHC class
XX CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
XX CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
XX CC system or cell is useful in the prevention and/or treatment of a disease,
XX CC particularly cancer. The detection method is useful for diagnosing or
XX CC monitoring the progression of a cancerous disease, and for detecting the
XX CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
XX CC is useful in the manufacture of a medicament for treating and/or
XX CC preventing a disease. This polynucleotide sequence represents the feline
XX CC 5T4 antigen coding DNA of the invention.

PT detecting E. coli O157:H7 in a sample, or in designing diagnostic probes
PT which can be used to distinguish strain O157:H7 from strain K12 using
XX molecular techniques.
XX
XX Claim 16; SEQ ID NO 57; 33pp; English.
XX
XX The invention relates to an isolated DNA molecule comprising an E. coli
XX strain O157:H7 sequence selected from a clostridial cytotoxin-like gene,
XX a urease gene cluster, a KIX toxin-like gene cluster, a locus of
XX enterocyte effacement and 2 genes from its associated lymphocytic phage
XX 933W (a putative serine/threonine kinase and a tail fibre gene). E. coli
XX O157:H7 can cause food poisoning, specifically acute haemorrhagic colitis
XX (which can develop into haemolytic uraemic syndrome). Also included are
XX an isolated DNA molecule comprising a nucleotide sequence identical to at
XX least 25 contiguous nucleotides contained in DNA sequences selected from
XX ACD18988-ACD19242 (being 255 E.coli O157 DNA sequences which are not
XX found in E.coli K12), a recombinant DNA construction comprising the DNA
XX above and a method for detecting E. coli O157:H7 (ATCC 43895) in a sample
XX (or distinguishing between O157 and K12) using a probe derived from one
XX of the 255 sequences. The DNA sequences are useful in detecting E. coli
XX O157:H7 in a sample, for the early diagnosis of humans and livestock
XX infected with O157:H7, and in designing diagnostic probes which can be
XX used to distinguish strain O157:H7 from strain K12 using molecular
XX techniques. The present sequence is one of the 255 E. coli O157:H7 DNA
XX sequence (termed OZID_1-OZID255). Note: The sequence data for this patent
XX did not form part of the printed specification, but was obtained in
XX electronic format directly from the USPTO at
XX seqdata.uspto.gov/sequence.html?docID=20030023075 (Updated on 27-OCT-2003
XX to standardise OS field)

 FT
 FT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 FT response useful in vaccinating against and in treating tumors.
 FT
 FT Disclosure; Page 78-79; 79pp; English.
 FT
 FT The present sequence encodes the canine 5T4 tumour-associated antigen
 FT (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC human or murine 5T4 gene sequence. The 5T4 antigen was shown to be
 CC effective at eliciting an immunotherapeutic anti-tumour response. Both
 CC the nucleic acid encoding the antigen and the antigen itself can be used
 CC to elicit an immune response, preferably CTL or an antibody response in a
 CC subject

XX
XX New recombinant DNA construct comprising a promoter positioned to provide
PT for expression of a polynucleotide encoding a polypeptide from a
PT microbial source, useful for producing plants with improved properties.
XX
XX Claim 1; SEQ ID NO 44017; 122pp; English.
XX
XX The invention relates to a recombinant DNA construct comprising a
CC promoter functional in a plant cell, where the promoter is positioned to
CC provide for expression of a polynucleotide encoding a polypeptide from a
CC microbial source. The invention also relates to a transformed plant
CC comprising the recombinant DNA construct and a method of producing a
CC transformed plant having an improved property. The plant is a crop plant
CC such as maize or soybean. The method of producing a transformed plant
CC having an improved property comprises transforming a plant with the
CC recombinant DNA construct and growing the transformed plant, where the
CC polynucleotide or polypeptide is useful for improving plant properties.
CC The recombinant DNA construct is useful for producing plants with
CC improved plant properties, e.g. improved cold, heat or drought tolerance,
CC tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
CC increased resistance to plant disease, better growth rate by modification
CC of the cell cycle pathway with plant growth regulators, increased rate of
CC homologous recombination, modified seed oil or protein yield and/or
CC content, improved yield by modification of carbohydrate, nitrogen or
CC phosphorus use and/or uptake, by modification of photosynthesis or by
CC providing improved plant growth and development under at least one stress
CC condition, improved lignin production or improved galactomannan
CC production. This sequence represents a bacterial polynucleotide used in
CC the scope of the invention. Note: The sequence data for this patent did
CC not form part of the printed specification but was obtained in electronic
CC format from USPTO at seqdata.uspto.gov/sequence.html.

PT Human Ip36 homozygosity deletion domain from the 36-position of first chromosome short arm in human neuroblastoma cell lines, applicable e.g. in gene diagnosis of tumors as well as in developing anti-cancer drugs.

XX

PS Example 8; Page 104-118; 226pp; Japanese.

XX

CC The present invention describes a homozygosity deletion domain co-existing in the 36-position of the first chromosome short arm (Ip36) in human neuroblastoma. Also described are base sequences from the Ip36 position of human neuroblastoma cell lines (NB-1 and MASS-NB-SCH-1), which are tumour suppressor genes in human neuroblastoma. The genes are tumour suppressor genes, base sequence data of which are applicable as tumour markers and reagents in studying mechanism of tumour body formation, and gene diagnosis of tumours as well as in developing anti-cancer drugs. AAF9787 to AAF97829 represent PCR primers used in the exemplification of the present invention, and AAF97830 to AAF97874 represent sequences given in the exemplification of the present invention

PT An isolated or purified human kinesin-like protein (HKLP) encoding polynucleotide used to detect HKLP polynucleotides in a sample comprises a contiguous span of at least 12 nucleotides.

XX

PS Claim 1; Page 143-175; 199pp; English.

XX

CC The present invention describes the coding and protein sequences of the human kinesin-like protein HKLP. It is thought that the protein could be involved in neurological disorders, infertility, spontaneous abortion, neonatal chromosome disorders, aneuploidy and cancers. This is due to its function in the movement of microtubules. The protein shows homology to the murine KIF1A and KIF1B proteins. The sequences disclosed in the invention can be used in the isolation of similar human proteins and in vector production. In addition, the biallelic markers shown can be used in disease diagnosis and population studies

 XX Polymorphic bovine DNA markers - used in genetic identification, gene
 mapping, and selective breeding.
 XX Table 7; Page 339; 517pp; English.
 XX The sequence is upstream of a bovine microsatellite sequence obtd. by
 screening a library of bovine Mb01 DNA fragments of between 250 and 500
 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
 clones cross-hybridised. Assuming independent distribution of
 microsatellites and Mb01 sites, the frequency of (T6)n > 9 microsatellites
 in the bovine genome is estimated at >100, 000. The sequence information
 for ca. 230 such bovine microsatellites is summarised in the
 CC specification and indexed herein (see below). The sequences upstream and
 CC downstream of the microsatellite sequence were used to generate the
 CC required PCR primers for in vitro amplification of the corresp.
 CC microsatellite (using the program OPTIPRIM). The microsatellites may be
 CC used to identify individuals, for parentage testing, and in the genetic
 CC mapping of economic trait loci, or genes involved in the determination of
 CC economically important traits esp. in cattle, to allow selective
 CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
 field.)

 XX New isolated nucleic acid molecule, useful for drug screening and
 toxicity assays or for assessing the impact, including toxicity, of a
 compound, pharmaceutical agent or environmental pollutant on a cell or
 living organism.
 XX Claim 1; SEQ ID NO 587; 41pp; English.
 XX This invention is related to a novel isolated canine nucleic acid
 sequences and the construction of canine microarrays containing a
 significant portion of the canine genome. The isolated canine nucleic
 acid sequences of the invention may be useful for drug screening and
 toxicity assays. The invention is therefore useful for assessing the
 impact, including toxicity, of a compound, pharmaceutical agent or
 environmental pollutant on a cell or living organism. The methods are
 useful for detecting genes that are up- or down-regulated in canines in a
 disease state. The sequences are useful as diagnostic agents or markers
 to detect a cellular response in a sample individually or as part of a
 gene expression profile. It is also useful as a target for agents that
 modulate gene expression or activity. The database is useful for
 producing electronic Northern blots that allow the user to determine the cell
 type or tissue in which a given gene is expressed and to allow the
 determination of the abundance or expression level of a given gene in a
 particular tissue or cell. The methods are useful for determining the
 similarity of a toxic response to one or more individual compounds. The
 methods are useful for predicting at least one toxic response or the
 likelihood that a compound or test agent will induce various specific
 pathologies such as those of the liver (liver necrosis, fatty liver
 disease, protein adduct formation or hepatitis), those of the kidney,
 heart, brain or testes, or other pathologies associated with at least one
 of the toxins. The methods are also useful for predicting or elucidating
 the potential cellular pathways influenced, induced or modulated by the
 compound or test agent due to the similarity of the expression profile
 compared to the profile induced by a known toxin. The present sequence is
 that of a canine DNA sequence which was claimed for use during the
 production of a canine microarray of the invention.

 XX Identifying agent that modulates activity of cancer-related gene, by
 PT contacting compound with cell, to promote expression of gene, and
 PT detecting difference in expression of gene relative to when compound is
 PT not present, to identify agent.
 XX
 XX Claim 1; SEQ ID NO 67; 131pp; English.
 XX
 CC The present invention relates to methods of screening cancer-linked genes
 CC and expression products for cancer diagnosis, and for screening potential
 CC anti-cancer agents. Specifically claimed is a method of identifying (M1)
 CC an agent that modulates activity of cancer-related genes, by contacting a
 CC compound with a cell expressing a gene under conditions promoting the
 CC expression of gene, and detecting difference in expression relative to
 CC when the compound is not present. Also claimed are methods of identifying
 CC (M2) an anti-neoplastic agent, by contacting a cell exhibiting neoplastic
 CC activity with a compound first identified as a cancer related gene
 CC modulator by (M1), and detecting a decrease in the neoplastic, or
 CC administering agent identified by (M1) to an animal exhibiting a cancer
 CC condition and detecting a decrease in the cancerous condition. Also given
 CC is a protein (I), which has at least one immunogenic fragment; an
 CC antibody that reacts with a protein; an immunoconjugate comprising the
 CC antibody and a cytotoxic agent. The agent is useful for treating cancer,
 CC by contacting a cancerous cell in vivo with an agent having activity
 CC against an expression produced encoded by a gene sequence given in the
 CC specification. The agent is also useful for treating cancer in an animal,
 CC by eliciting the production of cytotoxic T lymphocytes specific for the
 CC protein. Also described is a method of diagnosing prostate cancer. The
 CC proteins are anion transport proteins specific for prostate cancer. The
 CC present sequence is cDNA encoding a prostate cancer-specific hypothetical
 CC protein CGI-96, unigene cluster Hs.360940.

XX Novel human proteins and nucleic acid encoding the proteins, useful for
 PT diagnosis, treatment and prevention of disorders involving the human
 PT protein or nucleic acid e.g. cardiac and neurological disorders.

XX Claim 20; Page 118-119; 460pp; English.

XX The present invention describes isolated human NOVX proteins, where X is
 CC 1 to 42. ACC62236 to ACC62345 encodes the human NOVX proteins given in
 CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiac,
 CC hypotensive, dermatological, anorectic, immunosuppressive, cytostatic,
 CC antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,
 CC antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic,
 CC antiparkinsonian and antilipemic activities, and can be used in gene
 CC therapy. NOVX proteins are useful for treating or preventing a pathology
 CC associated with a NOVX protein in humans and for treating a syndrome
 CC associated with the human disease. NOVX nucleic acids, proteins and
 CC antibodies can be used in the treatment and diagnosis of cardiomyopathy,
 CC atherosclerosis, hypertension, congenital heart defects, aortic stenosis,
 CC valve disease, tuberosus sclerosis, scleroderma, obesity, transplantation,
 CC congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic
 CC disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia,
 CC hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host
 CC disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis,
 CC infectious disease, anorexia, cancer-associated cachexia, cancer,
 CC Alzheimer's disease, Parkinson's disease, immune disorders,
 CC haematopoietic disorders, dyslipidaemias, and metabolic syndrome X.
 CC ACC62346 to ACC62465 represent PCR primers and probes for human NOVX
 CC sequences, which are used in examples from the present invention.
 CC ABR54277 represents a human tryptophan protein given in comparison with
 CC the human NOV35b protein in the exemplification of the present invention

XX New pharmaceutical composition, useful for the manufacture of an agent
 PT for diagnosing, treating or preventing disorders related to body-weight
 PT regulation and thermogenesis, e.g., metabolic diseases such as obesity.

XX Claim 2; Fig 17B; 144pp; English.

XX The invention relates to a novel pharmaceutical composition comprising a
 CC nucleic acid molecule or polypeptide which is a human homologue of a
 CC drosophila melanogaster polypeptide or polynucleotide. The composition of
 CC the invention may be utilised during the diagnosis, study, prevention and
 CC treatment of diseases related to body-weight regulation and thermogenesis
 CC including metabolic disorders such as obesity, Syndrome X and insulin-
 CC resistance syndrome and eating disorders e.g. cachexia, diabetes
 CC mellitus, hypertension, pancreatic dysfunctions, arteriosclerosis,
 CC coronary heart disease, hypercholesterolaemia, dyslipidaemia,
 CC osteoarthritis and gallstones. Furthermore, disorders related to reactive
 CC oxygen species (ROS) defence may be addressed by the invention including
 CC neurodegenerative disorders or mitochondrial disorders. Finally, the
 CC composition of the invention may be useful in gene therapy. The current
 CC sequence is that of the cDNA encoding the human homologue of fruit fly
 CC kraken of the invention

 XX New nucleic acid molecule and encoded polypeptide, for diagnosing,
 PT preventing or treating cell proliferative disorders such as cancer.
 XX Claim 1; SEQ ID NO 4399; 5504pp; English.
 XX The present invention describes an isolated tumour-associated antigenic
 CC target (TAT) nucleic acid comprising: (a) any of 4622 nucleotide
 CC sequences (see SEQ ID NO:1 to 4622); (b) the full-length coding region of
 CC (a); (c) the complement of (a) or (b); (d) a sequence that has 80%
 CC sequence identity to (a)-(c); or (e) a sequence that hybridises to (a)-
 CC (c). Also described: (1) an expression vector comprising the above
 CC nucleic acid; (2) a host cell comprising the above expression vector; (3)
 CC a process for producing a polypeptide; (4) an isolated polypeptide
 CC comprising: (a) an amino acid sequence encoded by any of the above
 CC nucleotide sequences; (b) an amino acid sequence encoded by the full-
 CC length coding region of the above nucleotide sequences; or (c) a sequence
 CC having at least 80% identical to (a) or (b); (5) a chimeric polypeptide
 CC comprising the above polypeptide fused to a heterologous polypeptide; (6)
 CC an isolated antibody that binds to the above polypeptide; (7) a process
 CC for producing the antibody; (8) an isolated oligopeptide that binds to
 CC the above polypeptide; (9) a tumour-associated antigenic target (TAT)
 CC binding organic molecule that binds to the above polypeptide; (10) a
 CC composition of matter comprising the above (chimeric) polypeptide,
 CC antibody, oligopeptide or TAT binding organic molecule, in combination
 CC with a carrier; (11) an article of manufacture comprising a container and
 CC the composition of matter contained within the container; (12) methods of
 CC inhibiting the growth of a cell that expresses the above protein, where
 CC the growth of the cell is at least in part dependent upon a growth
 CC potentiating effect of the above protein; (13) a method of
 CC therapeutically treating a mammal having a cancerous tumour comprising
 CC cells that express the above protein; (14) a method of determining the
 CC presence of a protein in a sample suspected of containing the protein
 CC described above; (15) methods of diagnosing the presence of a tumour in a
 CC mammal; (16) a method for treating or preventing a cell proliferative
 CC disorder associated with increased expression or activity of the above
 CC protein; and (17) a method of binding an antibody, oligopeptide or
 CC organic molecule to a cell that expresses the protein described above.
 CC The TAT sequences have cytostatic activities, and can be used in gene
 CC therapy. The composition and methods are useful for diagnosing,
 CC preventing or treating cancer. The composition is also used for preparing
 CC a medicament for the therapeutic treatment or diagnostic detection of a
 CC cell proliferative disorder or cancer. The present sequence represents a
 CC human TAT cDNA sequence from the present invention.

XX Novel human proteins and nucleic acid encoding the proteins, useful for
 PT diagnosis, treatment and prevention of disorders involving the human
 PT protein or nucleic acid e.g. cardiac and neurological disorders.

XX Claim 20; Page 119; 460pp; English.

XX The present invention describes isolated human NOVX proteins, where X is
 CC 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in
 CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiac,
 CC hypotensive, dermatological, anorectic, immunosuppressive, cytostatic,
 CC antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,
 CC antiaesthetic, metabolic, immunomodulator, neuroprotective, nootropic,
 CC antiparkinsonian and antilipase activities, and can be used in gene
 CC therapy. NOVX proteins are useful for treating or preventing a pathology
 CC associated with a NOVX protein in humans and for treating a syndrome
 CC associated with the human disease. NOVX nucleic acids, proteins and
 CC antibodies can be used in the treatment and diagnosis of cardiomyopathy,
 CC atherosclerosis, hypertension, congenital heart defects, aortic stenosis,
 CC valve disease, tuberosus sclerosis, scleroderma, obesity, transplantation,
 CC congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic
 CC disorders, neoplasm, lymphoma, uterine cancer, fertility, haemophilia,
 CC hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host
 CC disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis,
 CC infectious disease, anorexia, cancer-associated cachexia, cancer,
 CC Alzheimer's disease, Parkinson's disease, immune disorders,
 CC haematopoietic disorders, dyslipidaemias, and metabolic syndrome X.
 CC ACC62346 to ACC62465 represent PCR primers and probes for human NOVX
 CC sequences, which are used in examples from the present invention.
 CC ABR54277 represents a human tryptinogen protein given in comparison with

PT Identifying agent that modulates activity of cancer-related gene, by
 PT contacting compound with cell, to promote expression of gene, and
 PT detecting difference in expression of gene relative to when compound is
 PT not present, to identify agent.

XX Claim 1; SEQ ID NO 62; 131pp; English.

XX The present invention relates to methods of screening cancer-linked genes
 CC and expression products for cancer diagnosis, and for screening potential
 CC anti-cancer agents. Specifically claimed is a method of identifying (M1)
 CC an agent that modulates activity of cancer-related genes, by contacting a
 CC compound with a cell expressing a gene under conditions promoting the
 CC expression of gene, and detecting difference in expression relative to
 CC when the compound is not present. Also claimed are methods of identifying
 CC (M2) an anti-neoplastic agent, by contacting a cell exhibiting neoplastic
 CC activity with a compound first identified as a cancer related gene
 CC modulator by (M1), and detecting a decrease in the neoplastic, or
 CC administering agent identified by (M1) to an animal exhibiting a cancer
 CC condition and detecting a decrease in the cancerous condition. Also given
 CC is a protein (I), which has at least one immunogenic fragment; an
 CC antibody that reacts with a protein; an immunoconjugate comprising the
 CC antibody and a cytotoxic agent. The agent is useful for treating cancer,
 CC by contacting a cancerous cell in vivo with an agent having activity
 CC against an expression produced encoded by a gene sequence given in the
 CC specification. The agent is also useful for treating cancer in an animal,
 CC by eliciting the production of cytotoxic T lymphocytes specific for the
 CC protein. Also described is a method of diagnosing prostate cancer. The
 CC proteins are anion transport proteins specific for prostate cancer. The
 CC present sequence is variant 4 DNA encoding a prostate cancer-specific
 CC protein, unigene cluster Hs.360940.

XX New isolated secreted polynucleotide for diagnosing or treating

PT conditions, diseases or disorders associated with cell signaling e.g.

PT arteriosclerosis, psoriasis, and cancer.

XX Claim 1a; SEQ ID NO 152; 486pp; English.

XX The invention relates to isolated purified secreted polynucleotides
CC (sptm) (I), and the polypeptides (SPTM) encoded by sptm. A polypeptide
CC encoded by (I) is used to identify a compound which binds to it. A
CC microarray comprising (I) is used to generate a transcript. (I) is used
CC to screen a compound for effectiveness in altering expression of (I). (I)
CC is used to assess toxicity of a test compound. An agonist or antagonist
CC identified by a new method is used in a pharmaceutical composition. The
CC secretory molecules are used to diagnose or treat conditions, diseases or
CC disorders associated with cell signaling e.g. arteriosclerosis,
CC psoriasis, and cancer. Sequences given in ADI40308-ADI40468 represent
CC human purified secretory polynucleotides of the invention, and those
CC given in ADI40469-ADI40631 represent the polypeptides they encode.

DEFINITION
AL449423 101155 bp DNA linear PRI 18-MAY-2005
Human DNA sequence from clone RP11-14912 on chromosome 9 Contains
the CDKN2A gene for cyclin-dependent kinase inhibitor 2A (melanoma,
p16, inhibits CDK4), the gene for susceptibility protein NSG-x
(LOC51198), the 5' end of a variant of the MTAP gene for
methylthiodenosine phosphorylase (MSAP), the 3' end of the CDKN2B
gene for cyclin-dependent kinase inhibitor 2B (p15, inhibits CDK4)
and 4 CpG islands, complete sequence.

email: submissions@watson.wustl.edu and jes@sanger.ac.uk

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems such as compressions and repeats; all regions were covered by sequence from more than one ml3 subclone.

For a graphical representation of this clone sequence and its analysis see:
http://www.wormbase.org/db/seq/sequence?name=Fl1H8;class=Sequence

NEIGHBORING CLONE INFORMATION

The 5' clone is C06E8, 2400 bp overlap; the 3' clone is R01H2, 200 bp overlap. Actual start of this clone is at base position 2397 of Fl1H8; actual end is at 11501 of R01H2.

NOTES:

Coding sequences below are the result of integration and manual review of the following data: computer analysis using the program GeneFinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C. elegans ORFeome cloning project (<http://wofdb.dfci.harvard.edu/>), similarity to other proteins from BlastX analyses (<http://blast.wustl.edu/>), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans researchers. TRNAs are predicted using the program TRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

            Center project name: L7802
            Center clone name: 354.D.13
            ----- Summary Statistics
            Sequencing vector: M13; M7815; 100% of reads
            Chemistry: Dye-terminator Big Dye; 100% of reads
            Assembly program: Phrap; version 0.960731
            Consensus quality: 121112 bases at least Q40
            Consensus quality: 127983 bases at least Q30
            Consensus quality: 130794 bases at least Q20
            Insert size: 147000; agarose-fp
            Insert size: 132480; sum-of-ctigs

```

Quality coverage: 3.4 in Q20 bases; egarose-fp
Quality coverage: 3.8 in Q20 bases; sum-of-contigs

NOTE: This is a 'working draft' sequence. It currently consists of 22 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Contact: submissions@watson.wustl.edu
----- Summary Statistics
Center project name: M_BA0312B17

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:

The RPCI-23 BAC Library has been constructed by Kazutoyo Osegaawa and Minako Tatenio in the laboratory of Pieter de Jong (<http://www.choxi.org>) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (<http://www.resgen.com>) or Pieter de Jong and coworkers at <http://www.choxi.org>

NEIGHBORING SEQUENCE INFORMATION:

This sequence is the entire insert of the clone.

AL354821/c AL354821 20087 bp DNA linear PRI 18-MAY-2005
LOCUS Human DNA sequence from clone RP11-538N17 on chromosome 13,
DEFINITION complete sequence.
ACCESSION AL354821
VERSION AL354821.21 GI:14160928
KEYWORDS HTG.
SOURCE Homo sapiens (human)
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Euarchontoglires; Primates; Catarrhini;
Homnidae; Homo.
REFERENCE 1 (bases 1 to 200087)
AUTHORS Lovell,J.
TITLE Direct Submission
JOURNAL Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vegas@sanger.ac.uk
Clone requests: clonerequests@sanger.ac.uk
On May 20, 2001 this sequence version replaced gi:13396481.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
En: EMBL; SW: SWISSPROT; Tr: TrEMBL; Wp: WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep
This sequence
was generated from part of bacterial clone contigs of human
chromosome 13, constructed by the Sanger Centre Chromosome 13
Mapping Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr13
RP11-538N17 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see
http://www.chori.org/bacpac/home.htm
VECTOR: pBACe3.6

Center: Wellcome Trust Sanger Institute
Center code: SC
Web site: http://www.sanger.ac.uk
Contact: vegas@sanger.ac.uk
-----

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one subclone; and the assembly was confirmed by restriction digest,
except on the rare occasion of the clone being a YAC.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw: SWISSPROT; Tr: TREMBL; Wp: WORMPEP; Information on the WORMPEP database can be found at

http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP23-4318 is from the RPCI-23 Mouse BAC library constructed by the group of Pieter de Jong.

Direct Submission
Unpublished
2 (bases 1 to 247964)
Rat Genome Sequencing Consortium.
Direct Submission
Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Project Information
Center project name: KZSP
Center clone name: CH230-unknown
----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 204240 bases at least Q40
Consensus quality: 208170 bases at least Q30

Consensus quality: 211194 bases at least Q20
 Estimated insert size: 204976; sum-of-contigs estimation
 Quality coverage: 5x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
 * (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
 * NOTE: This is a 'working draft' sequence. It currently
 * consists of 7 contigs. The true order of the pieces
 * is not known and their order in this sequence record is
 * arbitrary. Gaps between the contigs are represented as
 * runs of N, but the exact sizes of the gaps are unknown.
 * This record will be updated with the finished sequence.
 * as soon as it is available and the accession number will
 * be preserved.

* 1 28079: contig of 28079 bp in length
 * 28080: gap of unknown length
 * 28179: contig of 28179 bp in length
 * 28180: gap of unknown length
 * 51937: contig of 51937 bp in length
 * 52037: gap of unknown length
 * 229902: contig of 177866 bp in length
 * 229903: gap of unknown length
 * 230002: contig of 5775 bp in length
 * 230003: gap of unknown length
 * 235778: contig of 1094 bp in length
 * 235878: gap of unknown length
 * 236972: contig of 3025 bp in length
 * 237072: gap of unknown length
 * 240097: contig of 7768 bp in length.
 * 240197: gap of unknown length

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 DR New isolated polynucleotides, which are differentially expressed in colon
 XX cancer cell, useful for treating cancer, e.g. colon cancer, breast
 PT cancer, or pancreatic cancer.
 XX
 XX Claim 1; SEQ ID NO 2281; 97pp; English.
 PS
 CC The invention relates to 9672 polynucleotides (ACLU53866-ACLU63537) which
 CC are differentially expressed in colon cancer cells. The invention also
 CC relates to vectors and host cells comprising a differentially expressed
 CC polynucleotide of the invention; a method for detecting a cancerous cell
 CC by detection of a gene product of the polynucleotides; a method for
 CC inhibiting a cancerous phenotype of a cell by inhibiting a gene product
 CC of the polynucleotides; a method of treating an individual with cancer by
 CC administration of a modulator of a gene product of the polynucleotides;
 CC and an isolated antibody that specifically binds to a polypeptide encoded
 CC by one of the 9672 polynucleotides. The polynucleotides, polypeptides,
 CC antibodies, and methods are useful for the detection of cancerous cells;
 CC for the diagnosis, prognosis and management of cancer; for the
 CC identification of agents that modulate the phenotype of cancerous cells;
 CC and for the identification of therapeutic targets for cancer chemotherapy;
 CC and for the treatment of cancer, especially colon cancer and metastasized
 CC colon cancer, but also breast or pancreatic cancer. The polynucleotides
 CC are also useful as a source of probes or primers for use in diagnostic
 CC methods. The differentially expressed polynucleotides or their encoded
 CC proteins can additionally be used as vaccines to modulate primary immune
 CC responses for the prevention or treatment of cancer. The present sequence
 CC represents a specifically claimed polynucleotide which is differentially
 CC expressed in colon cancer. Note: The sequence data for this patent did
 CC not form part of the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

 PT Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 XX
 XX Claim 9; Page 372; 414pp; English.
 PS
 CC The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridizes to one of the 69 breast cancer-associated gene sequences shown
 CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

 XX
 XX Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 336; 453pp; English.
 XX
 XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 DR
 XX Detecting an ovarian cancer-associated transcript in a cell from a
 FT patient, comprises contacting a biological sample from the patient with a
 FT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 XX Claim 10; Page 297; 332pp; English.
 XX
 XX The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following ovarian
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

 XX Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.
 XX
 XX Claim 8; SEQ ID NO 41; 1395pp; English.
 XX
 XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;

and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

 XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. Diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 PT disorders, and asthma.
 XX Claim 16; Page 114-115; 619pp; English.

XX The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV9327-ABV9595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.
 CC The NOVX coding sequences and proteins are useful for treating,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious disease, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's

CC disease, immune disorders, haematopoietic disorders, cardiovascular
 CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substances for use in
 CC therapeutic or diagnostic methods

XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.

XX Claim 4; Page 68; 68pp; English.

XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in

CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 5T4 protein

XX

CC The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
 CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
PT response useful in vaccinating against and in treating tumors.
XX
XX Example 2; Page 78; 79pp; English.
XX
XX The present sequence encodes the human 5T4 tumour-associated antigen

CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject

XX
XX Disclosure; Fig 26; 118pp; English.
PS

XX The specification describes the use of a single chain antibody (ScFv),
CC which is capable of recognizing a disease associated molecule in the
CC manufacture of a medicament for the prevention and treatment of a disease
CC condition. The ScFv antibody is useful in the manufacture of a
CC medicament, for affecting a disease in vivo, for preparing a
CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
CC treatment of a disease. The ScFv antibody is also useful for treating
CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
CC diseases, cancers, central nervous system disorders including Parkinson's
CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
CC related diseases, and other immune disorders. The present sequence
CC encodes a 574 protein, which is used to produce ScFv of the invention

XX
PS Disclosure; Page 75-76; 99pp; English.

CC The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

XX PT New genes regulated by MYCN activation, useful in gene therapy,
 PT particularly for treating a subject with e.g. neuroblastoma or other
 PT cancers, or for diagnosing, staging or monitoring the treatment of the
 PT cancer.

XX XX Claim 1; SEQ ID NO 105; 27pp; English.

XX CC This invention relates to novel isolated cDNAs that are differentially
 CC expressed in MYCN activated cells. Specifically, it refers to
 CC polynucleotide sequences that exhibit differential expression patterns in
 CC cells activated by the transactivator MYCN, where MYCN is a proto-
 CC oncogene that is amplified in neuroblastoma cells and is common in small
 CC cell lung cancers. The present invention describes these cDNA molecules

CC as useful for in hybridisation assays to detect expression of nucleic
 CC acids (or complementary nucleic acids) in a present in a given sample, as
 CC well as for screening assays by identifying molecules or compounds that
 CC specifically bind the cDNA as a ligand and modulate function or activity.
 CC Accordingly, these compositions exhibit cytostatic activity and can also
 CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
 CC that is differentially expressed in MYCN activated cells, given in an
 CC exemplification of the invention. NOTE: This sequence does not appear in
 CC the printed specification but has been obtained in electronic format from
 CC the US Patent Office at
 CC ftp.segdata.uspto.gov/sequence.html?DocID=20030119009.

XX PT Detecting a bladder cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT bladder cancer-associated polynucleotide or antibody.

XX XX Claim 6; Page 296; 307pp; English.

XX CC The present invention describes a method for detecting a bladder cancer-
 CC associated transcript in a cell from a patient. The method comprises
 CC contacting a biological sample from the patient with a polynucleotide
 CC that selectively hybridises to a sequence that is 80 % identical to a
 CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
 CC encode the human bladder cancer-associated proteins given in ABR48146 to

CC ABR48242). Bladder cancer-associated sequences from the present invention
 CC have cytostatic activities, and can be used in antisense gene therapy and
 CC in vaccine production. The method can be used for detecting a bladder
 CC cancer-associated transcript in a cell from a patient. The method is
 CC useful in diagnosing or treating bladder cancer and in screening for
 CC compounds that modulate bladder cancer, such as hormones or antibodies.
 CC The nucleic acid molecules from the present invention may be used in
 CC various screening and diagnostic methods, and for gene therapy, vaccine
 CC and/or antisense/inhibition applications

XX Detecting a lung cancer-associated transcript in a cell from a patient

XX for treating lung cancer, by contacting a biological sample from the

XX patient with a polynucleotide that exhibits increased or decreased

XX expression in lung cancer.

XX Claim 22; Page 335; 453pp; English.

XX The invention relates to a method for detecting a lung cancer-associated

XX transcript in a cell from a patient, comprising contacting a biological

CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX PT Determining the presence or absence of a pathological cell in a patient,
XX PT useful for diagnosing, prognosing or treating cancer, comprises detecting

PT a nucleic acid in a biological sample.
XX
PS Claim 8; SEQ ID NO 39; 1385pp; English.
XX
CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064) whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularisation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.

XX New antibody that binds to a tumor-associated antigenic target (TAT) polypeptide, useful for preparing a composition for diagnosing or treating cancer.
PT
PS Claim 1; SEQ ID NO 53; 319pp; English.
XX
XX The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polynucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanized antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT cDNA sequence of the invention.

XX New tumor-associated antigenic target polypeptides and nucleic acids,
 PT useful in preparing a medicament for treating or detecting a
 PT proliferative disorder, e.g. breast, lung, colorectal, ovarian or
 PT prostate cancer or tumor.

XX Claim 1; SEQ ID NO 2070; 7273pp; English.

XX The invention relates to human tumour-associated antigenic target (TAT)
 CC polypeptides, and their related nucleic acids. The TAT polypeptides are
 CC overexpressed in cancer tissues compared to normal tissues, and may thus
 CC serve as effective targets for the diagnosis and treatment of cancer in
 CC mammals. The invention also relates to nucleic acid and polypeptide
 CC sequences at least 80% identical to the TAT nucleic acids and
 CC polypeptides; expression vectors and host cells comprising a TAT nucleic
 CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
 CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
 CC TAT polypeptide; and methods and compositions for the treatment or
 CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
 CC antibodies, antagonists, binding molecules and compositions are useful
 CC for diagnosing or treating a cell proliferative disorder associated with
 CC increased TAT expression, particularly cancers such as breast cancer,
 CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
 CC cancer, pancreatic cancer, cervical cancer, cancers of the central
 CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
 CC used as hybridisation probes, in chromosome and gene mapping, in
 CC chromosome identification and in gene therapy. The present sequence
 CC represents a TAT nucleic acid of the invention

XX Identifying a compound that can treat disease or disorders, such as, a

XX neuropsychiatric disorder e.g., schizophrenia, or autism, comprises

XX determining the expression of one or more efficacy genes in a cell

XX contacted with the test compound.

XX Example 6; SEQ ID NO 174; 39pp; English.

XX This invention relates to a novel screening method identified as a multi-

XX parameter high throughput screening (MPHTS) assay. Specifically, it

XX refers to an assay that utilizes the disease signature of a plurality of

XX specific genes associated with a particular disease, and identifies

XX differential expression between those cells taken from individuals

XX affected by that disease and those that are not affected. The present

XX invention then describes the screening of candidate pharmaceutical

XX compounds to identify those that have a potential therapeutic benefit for

XX the treatment of neuropsychiatric and neurodegenerative disorders

XX including schizophrenia, bipolar affective disorder (BAD) and autism, as

XX well as Parkinson's and Alzheimer's disease. Accordingly, the compounds

XX of this invention exhibit various activities including neuroleptic,

XX nootropic, antimanic and antidepressant. Furthermore, the screening

XX method used in MPHTS will be automated, such that a large number of test

XX compounds may be rapidly screened with a minimal amount of labour and

XX effort. This polynucleotide is a human cDNA sequence of a gene that is

CC differentially expressed in the presence of a therapeutic compound and

CC represents an exemplary efficacy gene for bipolar affective disorder,

CC given in an exemplification of the invention.

XX New isolated polynucleotide and encoded polypeptides, useful in

XX diagnostics, forensics, gene mapping, identification of mutations

XX responsible for genetic disorders or other traits and to assess

XX biodiversity.

XX Claim 1; SEQ ID NO 22979; 103pp; English.

XX The invention relates to isolated polynucleotide (I) and polypeptide (II)

XX sequences. (I) is useful as hybridisation probes, polymerase chain

XX reaction (PCR) primers, oligomers, and for chromosome and gene mapping,

XX and in recombinant production of (II). The polynucleotides are also used

XX in diagnostics as expressed sequence tags for identifying expressed

XX genes. (I) is useful in gene therapy techniques to restore normal

XX activity of (II) or to treat disease states involving (II). (II) is

XX useful for generating antibodies against it, detecting or quantitating a

XX polypeptide in tissue, as molecular weight markers and as a food

XX supplement. (II) and its binding partners are useful in medical imaging

XX of sites expressing (II). (I) and (II) are useful for treating disorders

XX involving aberrant protein expression or biological activity. The

XX polypeptide and polynucleotide sequences have applications in

XX diagnostics, forensics, gene mapping, identification of mutations

XX responsible for genetic disorders or other traits to assess biodiversity

CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in

XX CC The invention relates to primers for synthesizing full length cDNA
 CC clones. 830 cDNA molecules encoding a human protein have been isolated
 CC and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
 CC been determined. Primers for synthesizing the full length cDNA are useful
 CC for clarifying the function of the protein encoded by the cDNA. The full
 CC length clones were obtained by construction of full length enriched cDNA
 CC libraries that were synthesised by the oligo-capping method. The primers
 CC enable the production of the full length cDNA easily without any special
 CC methods. The present sequence is a full length human cDNA of the
 CC invention. Note: The sequence data for this patent did not form part of
 CC the printed specification, but was obtained in CD-ROM format directly
 CC from EPO

XX PT New signal transducer and activator of transcription 6 activation
XX PT promoting purified protein, for diagnosing and treating disease
XX PT associated with activation/inhibition of transcription factor e.g.
XX PT diabetes and cancer.
XX PS Claim 4; SEQ ID NO 127; 1368pp; English.
XX CC The invention relates to a purified protein promoting signal transducer
XX CC and activator of transcription 6 activation (STAT6). The protein is
XX CC useful for the producing an antibody, which involves administering the
XX CC protein or its epitope-bearing fragments to a non-human animal as an
XX CC antigen. The nucleic acid is useful for diagnosing a disease or
XX CC susceptibility to a disease related to expression or activity of the
XX CC protein. A transformant expressing the protein is useful for screening
XX CC compounds which inhibit or promote STAT6 activation. A transformant
XX CC expressing the protein is useful for producing a pharmaceutical
XX CC composition. Compositions, antibodies and antisense molecules are useful
XX CC for the treating a disease associated with STAT6 activation such as
XX CC allergic diseases, inflammation, autoimmune diseases, diabetes,
XX CC hyperlipidaemia, infections disease and cancers. Compositions are useful
XX CC for treating disease associated with STAT6 activation and/or prevention
XX CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
XX CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
XX CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
XX CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
XX CC activity. The protein or nucleic acid is effectively useful for screening
XX CC compounds for treating and preventing disease associated with excessive
XX CC activation or inhibition of STAT6. The present sequence represents a
XX CC human cDNA encoding a protein which promotes STAT6 activation.

XX PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX PS response useful in vaccinating against and in treating tumours.
XX PS Example 2; Page 78; 79pp; English.

XX CC The present sequence encodes the mouse 5T4 tumour-associated antigen
XX CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX CC carcinomas but has a highly restricted expression pattern in normal adult
XX CC tissues. It appears to be strongly correlated to metastasis in colorectal
XX CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX CC induced were inoculated with a virus expression vector containing the
XX CC present sequence. The 5T4 antigen was shown to be effective at eliciting
XX CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
XX CC the antigen and the antigen itself can be used to elicit an immune
XX CC response, preferably CTL or an antibody response in a subject. The
XX CC present sequence appears in GenBank at accession number AJ012160

 XX New signal transducer and activator of transcription 6 activation
 PT promoting purified protein, for diagnosing and treating disease
 PT associated with activation/inhibition of transcription factor e.g.
 PT diabetes and cancer.
 XX
 XX Claim 4; SEQ ID NO 125; 1368pp; English.
 PS
 XX The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC viral hepatitis and AIDS. The protein has effectively promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas.

Claim 1; SEQ ID NO 1316; 245pp; English.

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA nucleic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinomas (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence represents a specifically claimed human CA nucleic acid sequence of the invention. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

DR Determining the degree of cytosine methylation in genomic DNA, useful for
 XX diagnosis and prognosis, comprises selective hybridization of amplicons
 XX from chemically treated DNA.

PS Claim 12; 56pp + Sequence Listing; 56pp; German.

XX This invention describes a novel method for determining the degree of
 CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a
 CC genomic sample of DNA. The sample is treated chemically to convert
 CC cytosine (C) but not methylated C, to uracil, then part of the genomic
 CC DNA that contains the target C is amplified to form a labeled amplicon.
 CC The amplicon is hybridised to two classes, each with at least one member,
 CC of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the
 CC degree of hybridisation to both classes is determined from the label on
 CC the amplicon. From the ratio of labels hybridised to the two classes of
 CC oligomers, the degree of methylation is calculated. The method is used:
 CC (i) for diagnosis and/or prognosis of side effects of therapeutic drugs
 CC and of a wide range of diseases, e.g. cancer, disorders of the central
 CC nervous, cardiovascular, gastrointestinal and respiratory systems etc.,

CC particularly by detecting mutations or single nucleotide polymorphisms
 CC (SNP's); and (ii) for differentiation of cell or tissue types and for
 CC investigating cell differentiation. The method allows the methylation
 CC status of many C residues to be determined simultaneously. ABQ13410-
 CC ABQ54121 represent genomic DNA sequences used to illustrate the method
 CC for determining the degree of cytosine methylation described in the
 CC disclosure of the invention

PS Claim 12; 56pp + Sequence Listing; 56pp; German.

XX

CC This invention describes a novel method for determining the degree of
 CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a
 CC genomic sample of DNA. The sample is treated chemically to convert
 CC cytosine (C) but not methylated C, to uracil, then part of the genomic
 CC DNA that contains the target C is amplified to form a labeled amplicon.
 CC The amplicon is hybridised to two classes, each with at least one member,
 CC of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the
 CC degree of hybridisation to both classes is determined from the label on
 CC the amplicon. From the ratio of labels hybridised to the two classes of
 CC oligomers, the degree of methylation is calculated. The method is used:
 CC (i) for diagnosis and/or prognosis of side effects of therapeutic drugs

CC and of a wide range of diseases, e.g. cancer, disorders of the central
 CC nervous, cardiovascular, gastrointestinal and respiratory systems etc.,
 CC particularly by detecting mutations or single nucleotide polymorphisms
 CC (SNP's); and (ii) for differentiation of cell or tissue types and for
 CC investigating cell differentiation. The method allows the methylation
 CC status of many C residues to be determined simultaneously. ABQ13410-
 CC ABQ54121 represent genomic DNA sequences used to illustrate the method
 CC for determining the degree of cytosine methylation described in the
 CC disclosure of the invention

XX New recombinant DNA construct comprising a promoter positioned to provide
 PT for expression of a polynucleotide encoding a polypeptide from a
 PT microbial source, useful for producing plants with improved properties.
 XX Claim 1; SEQ ID NO 26835; 122pp; English.

XX The invention relates to a recombinant DNA construct comprising a
CC promoter functional in a plant cell, where the promoter is positioned to
CC provide for expression of a polynucleotide encoding a polypeptide from a
CC microbial source. The invention also relates to a transformed plant
CC comprising the recombinant DNA construct and a method of producing a
CC transformed plant having an improved property. The plant is a crop plant
CC such as maize or soybean. The method of producing a transformed plant
CC having an improved property comprises transforming a plant with the
CC recombinant DNA construct and growing the transformed plant, where the
CC polynucleotide or polypeptide is useful for improving plant properties.
CC The recombinant DNA construct is useful for producing plants with
CC improved plant properties, e.g. improved cold, heat or drought tolerance,
CC tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
CC increased resistance to plant disease, better growth rate by modification
CC of the cell cycle pathway with plant growth regulators, increased rate of
CC homologous recombination, modified seed oil or protein yield and/or
CC content, improved yield by modification of carbohydrate, nitrogen or
CC phosphorus use and/or uptake, by modification of photosynthesis or by
CC providing improved plant growth and development under at least one stress
CC condition, improved lignin production or improved galactomannan
CC production. This sequence represents a bacterial polynucleotide used in
CC the scope of the invention. Note: The sequence data for this patent did
CC not form part of the printed specification but was obtained in electronic
CC format from USPTO at seqdata.uspto.gov/sequence.html.

XX Disclosure; SEQ ID NO 25737; 3071pp + Sequence Listing; English.
XX
XX AAK54951 to AAK64702 encode the human immune/hematopoietic antigen (I)
XX amino acid sequences given in AAK82170 to AAK91921. (I) have cytostatic
XX activity, and can be used in gene therapy and vaccine production. (I)
XX proteins and polynucleotides may be used in the prevention, diagnosis and
XX treatment of diseases associated with inappropriate (I) expression. For
XX example, they may be used to treat disorders associated with decreased
XX expression by rectifying mutations or deletions in a patient's genome
XX that affect the activity of (I) by expressing inactive proteins or to

CC supplement the patients own production of (I). Additionally, (I)
CC polynucleotides may be used to produce the secreted (I), by inserting the
CC nucleic acids into a host cell and culturing the cell to express the
CC protein. (I) proteins and polynucleotides may be used to prevent,
CC diagnose and treat immune/hematopoietic-related diseases, especially
CC cancers and cancer metastases of hematopoietic-derived cells. AAK64703
CC to AAK87694 represent human immune/hematopoietic antigen genomic
CC sequences from the present invention. AAK54942 to AAK54950 and AAK82169
CC represent sequences used in the exemplification of the present invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Clone distribution: MGC clone distribution information can be found
through the I.M.A.G.E. Consortium/LLNL at: <http://image.llnl.gov>
Series: IRAL Plate: 26 Row: m Column: 15
This clone was selected for full length sequencing because it
passed the following selection criteria: matched mRNA gi: 5729717.

Clone distribution: clone distribution information can be found at:
http://www.nih.go.jp/yoken/genebank/
Lab host: TOP10
Vector: pME18S-FL3 (Acc.No. AB009864)
R. Site1: DraIII (CACTGTGG)
R. Site2: DraIII (CACCATGG)
Description: 1st strand cDNA was primed with an oligo(dT) primer
[ATGTGCGCTTTTCTTTTCTTTT]; double-stranded cDNA was synthesized
using specific 5' and 3' primers and amplified by PCR. The PCR
product was digested with SfiI and size selection was performed to
exclude fragments <1.5kb. The SfiI-digested PCR product was cloned
into distinct DraIII sites of pME18S-FL3. XhoI sites just outside
the DraIII sites can be used to isolate the cDNA insert. Libraries
were constructed by oligo-capping method. Libraries were made from:
QCC8: cerebellum cortex
QMPA: parietal lobe
QTRA: temporal lobe right
QFLA: frontal lobe left
QMOA: medulla oblongata
QBSA: brain stem
QORA: occipital lobe right
QtsA: testis
Custom primers were used for 5' and 3'-end sequencing. The
full-insert sequencing was done by primer-walking method using ABI
DNA sequencer.

LOCUS

DEFINITION

Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15
Contains a single stranded DNA binding protein pseudogene, the TPBG
gene for trophoblast glycoprotein (574-AG) and a CpG island,
complete sequence.

Garner, P.
Direct Submission
Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vegas@sanger.ac.uk
Clone requests: clonerequests@sanger.ac.uk

On Dec 15, 2000 this sequence version replaced gi:11558491.

The following abbreviations are used to associate primary accession

numbers given in the feature table with their source databases:

Em: EMBL; Sw: SWISSPROT; Tr: TREMBL; Wp: WORMPEP; Information

on the WORMPEP database can be found at

http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence

was generated from part of bacterial clone contigs of human

chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping

Group. Further information can be found at

http://www.sanger.ac.uk/HGP/Chr6

RP3-492P14 is from the library RPI-3 constructed by the group of

Pieter de Jong. For further details see

http://www.chori.org/bacpac/home.htm

VECTOR: pCYPAC2

Web site: http://www.sanger.ac.uk

Contact: vegas@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=

30); an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

one subclone; and the assembly was confirmed by restriction digest,

except on the rare occasion of the clone being a YAC.

COMMENT	On Jun 28, 2004 this sequence version replaced gi:42627749. Genes were predicted from the integrated results of the following: GENSCAN (http://ccr-081.mit.edu/GENSCAN.html), PCGENESH (http://www.softberry.com/), GeneMark.hmm (http://opal.biology.gatech.edu/GeneMark/), GlimmerM (http://www.tigr.org/cdb/glimmer/gimr_form.html), RiceHMM (http://rgp.dna.affrc.go.jp/RiceHMM/), SplicePredictor (http://bioinformatics.iastate.edu/cgi-bin/sp.cgi), sim4 (http://globin.cse.psu.edu/html/docs/sim4.html), gap2 (http://www.tigr.org/software/glimmer/), BLASTN and BLASTX. The genomic sequence was searched against NCBI NonRedundant Protein database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at RGP or DBJ. Protein homologies of the coding regions were searched against NCBI NonRedundant Protein database with BLASTP. ESTs represent the identified cDNA sequences using BLASTN with the corresponding DBJ accession no. and RGP clone ID. Full-length cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DBJ accession no. A gene with identity or significant homology to a protein is classified based on the protein name to indicate the homology level such as same name, 'putative-' and '-like protein'. A gene without significant homology to any protein but with full-length cDNA or EST homology (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted by two or more gene prediction programs is classified as a 'hypothetical' protein according to IRGSP standard. A gene predicted by a single gene prediction program is also classified as a probable 'hypothetical' protein and is included as a miscellaneous feature of the sequence. The orientation of the sequence is from M13rev to -21M13 of the BAC clone. This sequence of OSJNBb0035N08 clone has an overlap with P0620H05 (DBJ: AP005394) clone at 5' end and with OJ1711.D06 (DBJ: AP004857) clone at 3' end. Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html. This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=

30); an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

one subclone; and the assembly was confirmed by restriction digest,

except on the rare occasion of the clone being a YAC.

NOTICE:

This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e. phred quality

```

>30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest. This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is minimal. If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:
The BAC Library has been constructed by Pieter de Jong and coworkers (<http://www.chori.org>) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at <http://www.chori.org>

This sequence is the entire insert of the clone.

Rat Genome Sequencing Consortium.
Direct Submission
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Nov 19, 2002 this sequence version replaced gi:23265004.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

Assembly program: Phrap; version 0.990329
Consensus quality: 201781 bases at least Q40
Consensus quality: 203921 bases at least Q30
Consensus quality: 205310 bases at least Q20
Estimated insert size: 205531; sum-of-contigs estimation
Quality coverage: 7x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 1 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submitter.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
* 1 210237: contig of 210237 bp in length.

Sequence submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley, CA 94720
This clone was sequenced as part of a high-throughput process to
sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
Science 2000). The sequence has been subjected to integrity checks
for sequence accuracy, presence of a polyA tail and contiguity
within 100 kb in the genome. Thus we believe the sequence to
reflect accurately this particular cDNA clone. However, there are
artifacts associated with the generation of cDNA clones that may
have not been detected in our initial analyses such as internal
priming, priming from contaminating genomic DNA, retained introns
due to reverse transcription of unspliced precursor RNAs, and
reverse transcriptase errors that result in single base changes.
For further information about this sequence, including its location
and relationship to other sequences, please visit our web site
(http://fruitfly.berkeley.edu) or send email to
cdna@fruitfly.berkeley.edu.

 Center clone name: 428_H_10

 * NOTE: This record contains 88 individual
 * sequencing reads that have not been assembled into
 * contigs. Runs of N are used to separate the reads
 * and the order in which they appear is completely
 * arbitrary. Low-pass sequence sampling is useful for
 * identifying clones that may be gene-rich and allows
 * overlap relationships among clones to be deduced.
 * However, it should not be assumed that this clone
 * will be sequenced to completion. In the event that
 * the record is updated, the accession number will
 * be preserved.
 * 1 670: contig of 670 bp in length
 * 671 770: gap of 100 bp

 ----- Summary Statistics

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:
 all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see

http://genome.wustl.edu

SOURCE INFORMATION:

The RPCI-24 BAC library has been constructed by Pieter de Jong and coworkers (http://www.chori.org) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at http://www.chori.org

NEIGHBORING SEQUENCE INFORMATION:

This sequence is the entire insert of the clone.

Direct Submission
Submitted (02-AUG-1999) Drosophila Genome Center, Lawrence Berkeley
Laboratory, MS 64-121, Berkeley, CA 94720, USA
On or before Feb 24, 2001 this sequence version replaced
gi:6806808, gi:6630504, gi:6630510.
Sequence submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory, MS 64-121
Berkeley, CA 94720
This sequence was assembled using end sequences from a whole genome
shotgun and from subclones of this BAC and its neighboring clones.
For further information about this sequence, including its location
and relationship to other sequences, please visit our sequence
archive Web site (http://www.fruitfly.org/sequence/) or send email
to bdgpf@fruitfly.berkeley.edu.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

XX
XX New isolated polynucleotides, which are differentially expressed in colon
XX cancer cell, useful for treating cancer, e.g. colon cancer, breast
XX cancer, or pancreatic cancer.
XX
XX Claim 1; SEQ ID NO 2281; 97pp; English.
XX
XX The invention relates to 9672 polynucleotides (ACLS3866-ACLS3537) which
XX are differentially expressed in colon cancer cells. The invention also
XX relates to vectors and host cells comprising a differentially expressed
XX polynucleotide of the invention; a method for detecting a cancerous cell
XX by detection of a gene product of the polynucleotides; a method for
XX inhibiting a cancerous phenotype of a cell by inhibiting a gene product
XX of the polynucleotides; a method of treating an individual with cancer by
XX administration of a modulator of a gene product of the polynucleotides;
XX and an isolated antibody that specifically binds to a polypeptide encoded
XX by one of the 9672 polynucleotides. The polynucleotides, polypeptides,
XX antibodies, and methods are useful for the detection of cancerous cells;
XX for the diagnosis, prognosis and management of cancer; for the
XX identification of agents that modulate the phenotype of cancerous cells;
XX for the identification of therapeutic targets for cancer chemotherapy;
XX and for the treatment of cancer, especially colon cancer and metastasized
XX colon cancer, but also breast or pancreatic cancer. The polynucleotides
XX are also useful as a source of probes or primers for use in diagnostic
XX methods. The differentially expressed polynucleotides or their encoded
XX proteins can additionally be used as vaccines to modulate primary immune
XX responses for the prevention or treatment of cancer. The present sequence
XX represents a specifically claimed polynucleotide which is differentially
XX expressed in colon cancer. Note: The sequence data for this patent did
XX not form part of the printed specification, but was obtained in
XX electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

 XX Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX Claim 10; Page 297; 332pp; English.
 PS The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selection mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

 XX Determining the presence or absence of a pathological cell in a patient,
 XX useful for diagnosing, prognosing or treating cancer, comprises detecting
 XX a nucleic acid in a biological sample.
 XX Claim 8; SEQ ID NO 41; 1385pp; English.
 XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

XX
XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX response useful in vaccinating against and in treating tumors.
XX
XX Example 2; Page 78; 79pp; English.
XX
XX The present sequence encodes the human 5T4 tumour-associated antigen
XX (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX carcinomas but has a highly restricted expression pattern in normal adult
XX tissues. It appears to be strongly correlated to metastasis in colorectal
XX and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX induced were inoculated with a virus expression vector containing the
XX present sequence. The 5T4 antigen was shown to be effective at eliciting
XX an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
XX the antigen and the antigen itself can be used to elicit an immune
XX response, preferably CTL or an antibody response in a subject

 XX PT Identifying a candidate p53 pathway-modulating agent for treating cancer
 XX PT comprises contacting an assay system comprising a purified leucine rich
 XX PT repeat, capricious related polypeptide or nucleic acid with a test agent.
 XX PS Disclosure; Page 75-76; 99pp; English.
 XX CC The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

 XX PT New genes regulated by MYCN activation, useful in gene therapy,
 PT particularly for treating a subject with e.g. neuroblastoma or other
 PT cancers, or for diagnosing, staging or monitoring the treatment of the
 PT cancer.
 XX PS Claim 1; SEQ ID NO 105; 27pp; English.
 XX CC This invention relates to novel isolated cDNAs that are differentially
 CC expressed in MYCN activated cells. Specifically, it refers to
 CC polynucleotide sequences that exhibit differential expression patterns in
 CC cells activated by the transactivator MYCN, where MYCN is a proto-
 CC oncogene that is amplified in neuroblastoma cells and is common in small
 CC cell lung cancers. The present invention describes these cDNA molecules
 CC as useful for in hybridisation assays to detect expression of nucleic
 CC acids (or for complementary nucleic acids) in a present in a given sample, as
 CC well as for screening assays by identifying molecules or compounds that
 CC specifically bind the cDNA as a ligand and modulate function or activity.
 CC Accordingly, these compositions exhibit cytostatic activity and can also
 CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
 CC that is differentially expressed in MYCN activated cells, given in an
 CC exemplification of the invention. NOTE: This sequence does not appear in
 CC the printed specification but has been obtained in electronic format from
 CC the US Patent Office at
 CC ftp.segdata.uspto.gov/sequence.html?DocID=20030119009.

 DR Detecting a bladder cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT bladder cancer-associated polynucleotide or antibody.
 XX Claim 6; Page 296; 307pp; English.
 XX The present invention describes a method for detecting a bladder cancer-
 CC associated transcript in a cell from a patient. The method comprises
 CC contacting a biological sample from the patient with a polynucleotide
 CC that selectively hybridizes to a sequence that is 80 % identical to a
 CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
 CC encode the human bladder cancer-associated proteins given in ABR48146 to
 CC ABR48242). Bladder cancer-associated sequences from the present invention
 CC have cytostatic activities, and can be used in antisense gene therapy and
 CC in vaccine production. The method can be used for detecting a bladder
 CC cancer-associated transcript in a cell from a patient. The method is
 CC useful in diagnosing or treating bladder cancer and in screening for
 CC compounds that modulate bladder cancer, such as hormones or antibodies.
 CC The nucleic acid molecules from the present invention may be used in
 CC various screening and diagnostic methods, and for gene therapy, vaccine
 CC and/or antisense/inhibition applications

 DR Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX Claim 22; Page 335; 453pp; English.
 XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX Determining the presence or absence of a pathological cell in a patient,

XX useful for diagnosing, prognosing or treating cancer, comprises detecting

XX a nucleic acid in a biological sample.

XX Claim 8; SEQ ID NO 39; 1385pp; English.

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064) whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularisation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.

XX New antibody that binds to a tumor-associated antigenic target (TAT)

XX polypeptide, useful for preparing a composition for diagnosing or

XX treating cancer.

XX Claim 1; SEQ ID NO 53; 319pp; English.

XX The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polynucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT cDNA sequence of the invention.

 DR New tumor-associated antigenic target polypeptides and nucleic acids,
 PT useful in preparing a medicament for treating or detecting a
 PT proliferative disorder, e.g. breast, lung, colorectal, ovarian or
 PT prostate cancer or tumor.
 XX Claim 1; SEQ ID NO 2070; 7273pp; English.
 XX The invention relates to human tumour-associated antigenic target (TAT)
 CC polypeptides, and their related nucleic acids. The TAT polypeptides are
 CC overexpressed in cancer tissues compared to normal tissues, and may thus
 CC serve as effective targets for the diagnosis and treatment of cancer in
 CC mammals. The invention also relates to nucleic acid and polypeptide
 CC sequences at least 80% identical to the TAT nucleic acids and
 CC polypeptides; expression vectors and host cells comprising a TAT nucleic
 CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
 CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
 CC TAT polypeptide; and methods and compositions for the treatment or
 CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
 CC antibodies, antagonists, binding molecules and compositions are useful
 CC for diagnosing or treating a cell proliferative disorder associated with
 CC increased TAT expression, particularly cancers such as breast cancer,
 CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
 CC cancer, pancreatic cancer, cervical cancer, cancers of the central
 CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
 CC used as hybridisation probes, in chromosome and gene mapping, in
 CC chromosome identification and in gene therapy. The present sequence
 CC represents a TAT nucleic acid of the invention

 DR
 XX Identifying a compound that can treat disease or disorders, such as, a
 PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
 PT determining the expression of one or more efficacy genes in a cell
 PT contacted with the test compound.
 XX Example 6; SEQ ID NO 174; 39pp; English.
 PS This invention relates to a novel screening method identified as a multi-
 XX parameter high throughput screening (MPHTS) assay. Specifically, it
 CC refers to an assay that utilizes the disease signature of a plurality of
 CC specific genes associated with a particular disease, and identifies
 CC differential expression between those cells taken from individuals
 CC affected by that disease and those that are not affected. The present
 CC invention then describes the screening of candidate pharmaceutical
 CC compounds to identify those that have a potential therapeutic benefit for
 CC the treatment of neuropsychiatric and neurodegenerative disorders
 CC including schizophrenia, bipolar affective disorder (BAD) and autism, as
 CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
 CC of this invention exhibit various activities including neuroleptic,
 CC nootropic, antimanic and antidepressant. Furthermore, the screening
 CC method used in MPHTS will be automated, such that a large number of test
 CC compounds may be rapidly screened with a minimal amount of labour and
 CC effort. This polynucleotide is a human cDNA sequence of a gene that is
 CC differentially expressed in the presence of a therapeutic compound and
 CC represents an exemplary efficacy gene for bipolar affective disorder,
 CC given in an exemplification of the invention.

XX
XX New isolated polynucleotide and encoded polypeptides, useful in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits and to assess
XX biodiversity.
XX
XX Claim 1; SEQ ID NO 22979; 103pp; English.
XX
XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
XX sequences. (I) is useful as hybridisation probes, polymerase chain
XX reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
XX and in recombinant production of (II). The polynucleotides are also used
XX in diagnostics as expressed sequence tags for identifying expressed
XX genes. (I) is useful in gene therapy techniques to restore normal
XX activity of (II) or to treat disease states involving (II). (II) is
XX useful for generating antibodies against it, detecting or quantitating a
XX polypeptide in tissue, as molecular weight markers and as a food
XX supplement. (II) and its binding partners are useful in medical imaging
XX of sites expressing (II). (I) and (II) are useful for treating disorders
XX involving aberrant protein expression or biological activity. The
XX polypeptide and polynucleotide sequences have applications in
XX diagnostics, forensics, gene mapping, identification of mutations
XX and to produce other types of data and products dependent on DNA and
XX amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
XX coding sequences of the invention. Note: The sequence data for this
XX patent did not appear in the printed specification, but was obtained in
XX electronic format directly from WIPO at

XX New signal transducer and activator of transcription 6 activation
PT promoting purified protein, for diagnosing and treating disease
PT associated with activation/inhibition of transcription factor e.g.
PT diabetes and cancer.
XX
XX Claim 4; SEQ ID NO 127; 1368pp; English.
PS
XX The invention relates to a purified protein promoting signal transducer
CC and activator of transcription 6 activation (STAT6). The protein is
CC useful for the producing an antibody, which involves administering the
CC protein or its epitope-bearing fragments to a non-human animal as an
CC antigen. The nucleic acid is useful for diagnosing a disease or
CC susceptibility to a disease related to expression or activity of the
CC protein. A transformant expressing the protein is useful for screening
CC compounds which inhibit or promote STAT6 activation. A transformant
CC expressing the protein is useful for producing a pharmaceutical
CC composition. Compositions, antibodies and antisense molecules are useful
CC for the treating a disease associated with STAT6 activation such as
CC allergic diseases, inflammation, autoimmune diseases, diabetes,
CC hyperlipidaemia, infectious disease and cancers. Compositions are useful
CC for treating disease associated with STAT6 activation and/or prevention
CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
CC viral hepatitis and AIDS. The protein has efficiently promoting STAT6
CC activity. The protein or nucleic acid is effectively useful for screening
CC compounds for treating and preventing disease associated with excessive
CC activation or inhibition of STAT6. The present sequence represents a
CC human cDNA encoding a protein which promotes STAT6 activation.

DR
XX New nucleic acid associated with lactation, and muscle and fat
PT deposition, useful for genome mapping, gene identification and analysis,
PT cattle breeding, or for genetically improving cattle.
XX
XX Claim 2; SEQ ID NO 5770; 245pp; English.
XX
XX The invention relates to a purified nucleic acid molecule associated with
CC lactation or muscle and fat deposition (designated LMFD), derived from
CC cattle, and the LMFD nucleic acid can specifically hybridise to a second
CC nucleic acid molecule comprising any of 15112 nucleotide sequences,
CC appearing as ABX34836-ABX49947, or complements of them. Also included are
CC ; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic
CC acid linked to a promoter and a 3' non-translated sequence that
CC functions in the cell to cause termination of transcription and addition
CC of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
CC (2) determining a level or pattern of a molecule in a bovine cell or
CC tissue comprising: (a) incubating a marker nucleic acid (comprising any
CC of the 15112 nucleic acid sequences or its complement or fragment) with a
CC complementary nucleic acid molecule obtained from the bovine cell or
CC tissue, where hybridisation between the marker nucleic acid and the
CC complementary nucleic acid permits the detection of the molecule; where
CC detecting the level or pattern of the complementary nucleic acid, where
CC the detection of the complementary nucleic acid is predictive of the
CC level or pattern of the molecule. The LMFD nucleic acid is used for
CC determining a level or pattern of a molecule in a bovine cell or tissue.
CC It is useful for genome mapping, gene identification and analysis, cattle
CC breeding, preparation of constructs for use in cattle gene expression, or
CC for genetically improving cattle. The present sequence is one of the
CC 15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The
CC present sequence was not shown in the specification but was obtained in
CC electronic format from the USPTO web site:

XX The present invention relates to the isolation of canine and feline
CC oncofetal leucine-rich glycoproteins known as 5T4, and the
CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
CC a significant proportion of tumours. The sequences of the invention are
CC useful in a pharmaceutical composition for the prevention and/or
CC treatment of tumours or other diseases associated with cell
CC proliferation, infections, and inflammatory conditions in animals,
CC preferably dogs or cats. The compositions may also be used for cancer
CC immunotherapy in these animals. The sequences of the invention may also
CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
CC measurement and localisation of 5T4 in extracts of plasma, urine,
CC tissues, and in cell culture media. Antibodies specific for the 5T4
CC protein are useful for isolating foetal cells from maternal blood. The
CC isolation process may form part of a diagnostic method e.g. the foetal
CC cells may then be subject to biochemical or genetic sampling used for
CC testing foetal abnormalities, or to determine the sex of the foetus(es).
XX The present sequence encodes feline 5T4 protein

XX PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
XX PT disease, particularly cancer.
XX PS Disclosure; Page 67; 73pp; English.
XX CC The invention relates to a novel Major Histocompatibility Complex (MHC)
XX CC class I peptide epitope of the 5T4 antigen. The invention further
XX CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
XX CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
XX CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
XX CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
XX CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
XX CC comprising the above; a method for treating and/or preventing a disease
XX CC in a subject by administering the vaccine; an agent capable of binding
XX CC specifically to the 5T4 epitope and/or its encoding nucleic acid; a method
XX CC comprising detecting the presence of the 5T4 epitope or its encoding
XX CC nucleic acid in a subject; and a T cell line or clone capable of
XX CC specifically recognising the 5T4 epitope in conjunction with an MHC class
XX CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
XX CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
XX CC system or cell is useful in the prevention and/or treatment of a disease,
XX CC particularly cancer. The detection method is useful for diagnosing or
XX CC monitoring the progression of a cancerous disease, and for detecting the
XX CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
XX CC is useful in the manufacture of a medicament for treating and/or
XX CC preventing a disease. This polynucleotide sequence represents the feline
XX CC 5T4 antigen coding DNA of the invention.

 XX
 CC The specification describes the use of a single chain antibody (ScFv),
 CC which is capable of recognizing a disease associated molecule in the
 CC manufacture of a medicament for the prevention and treatment of a disease
 CC condition. The ScFv antibody is useful in the manufacture of a
 CC medicament, for affecting a disease in vivo, for preparing a
 CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
 CC treatment of a disease. The ScFv antibody is also useful for treating
 CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
 CC diseases, cancers, central nervous system disorders including Parkinson's
 CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
 CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
 CC related diseases, and other immune disorders. The present sequence
 CC encodes a 574 protein, which is used to produce ScFv of the invention

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
Claim 12; 56pp + Sequence Listing; 56pp; German.
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs

CC and of a wide range of diseases, e.g. cancer, disorders of the central
 CC nervous, cardiovascular, gastrointestinal and respiratory systems etc.,
 CC particularly by detecting mutations or single nucleotide polymorphisms
 CC (SNP's); and (ii) for differentiation of cell or tissue types and for
 CC investigating cell differentiation. The method allows the methylation
 CC status of many C residues to be determined simultaneously. ABQ13410-
 CC ABQ54121 represent genomic DNA sequences used to illustrate the method
 CC for determining the degree of cytosine methylation described in the

XX the expression of one or more liver toxicity predictive genes in the
XX sample from the individual treated with the agent.
XX PS Claim 7; Fig 4; 336pp; English.

XX CC The present invention describes a method for predicting the liver
XX toxicity in an individual to an agent. The method comprises: (a)
XX obtaining a biological sample from the individual treated with the agent;
XX (b) measuring the expression of one or more liver toxicity predictive
XX genes in the sample; and (c) using the test expression profile with a set
XX of reference expression profiles in a Predictive Model to determine
XX whether the agent will induce liver toxicity in the individual. Also
XX described: (1) predicting the liver toxicity of an agent using an in
XX vitro system; (2) predicting the liver toxicity in a biological sample
XX from an individual, in vitro cell cultures or explants to an agent via a
XX programmable machine; (3) a computer program product for enabling a
XX computer to perform Predictive Model analysis for liver toxicity on a
XX biological sample from an individual, in vitro cell cultures or explants
XX to an agent; (4) a computer system adopted to predict liver toxicity in a
XX biological system from an individual, in vitro cell cultures or explants
XX to an agent; (5) a computer program product for predicting liver toxicity
XX from a test sample expression profile; (6) mining genes predictive of
XX liver toxicity; (7) an integrated system for predicting liver toxicity;
XX and (8) identifying one or more liver inflammation predictive genes. The
XX method is useful for predicting the liver toxicity in an individual to an
XX agent. The present sequence represents a liver toxicity predictive gene
XX sequence that represents a 24 hour combo 3 gene, which is specifically
XX claimed in the exemplification of the present invention.

XX The invention relates to novel isolated kidney toxicity predictive genes and methods of using such genes in the field of toxicology. Specifically, it refers to novel genes that can be used for generating predictive models, which in turn are useful for predicting the in vivo toxic response to one or more agents. The present invention describes obtaining a gene expression profile from a biological sample and using the predictive model to determine whether an agent will induce kidney toxicity in the individual. As such, it can be used to detect any toxic effects that may be manifested as long lasting or chronic consequences including irreversible toxicity or carcinogenesis. Furthermore, the predictive genes can be considered as therapeutic targets for toxic damage or to ameliorate specific disease conditions such as kidney tubule necrosis or acute renal failure, as well as for additional screening assays. This polynucleotide sequence is the partial gene sequence of a rat kidney toxicity predictive gene of the invention.

XX New composition comprises cDNAs useful for detecting altered expression of genes in a toxic response of the spleen or for predicting toxic responses to one or more agents including lymphoid tissue types or other species.
XX Claim 1; SEQ ID NO 9; 249pp; English.

XX The invention relates to a novel composition comprising cDNAs for use in detecting the altered expression of genes in a toxic response of the spleen, where the cDNAs comprises 50-816 base pairs (ADR91045-ADR91348) or their complete complements. The invention further comprises:
XX monitoring the treatment of compound toxicity in a sample; predicting the spleen toxicity in an individual to an agent; predicting the spleen toxicity of an agent using an in vitro system; a computer program product for predicting spleen toxicity from an expression profile of nucleic acids from a sample under test, comprising a computer readable medium bearing an encrypted training data set, encrypted lists of genes selected from the cDNAs, and a predictive model for causing a general purpose computer to predict the spleen toxicity of the sample based upon the training data set, the list of genes selected from the cDNAs, and the expression profile of nucleic acids from the sample; and an integrated system for predicting spleen toxicity, comprising means for measuring gene expression profiles of spleen predictive genes from samples exposed to the test agent and a computer system operably linked to the means that is capable of implementing a predictive model. The composition comprising cDNAs is useful for detecting altered expression of genes in a toxic response of the spleen or for predicting toxic responses to one or more agents including lymphoid tissue types or other species. The predictive genes and models of the invention are useful for identifying and evaluating various in vitro systems that can be used to accurately predict in vivo toxicity. This polynucleotide sequence represents one of the genes predictive for spleen necrosis of the invention.

PT Monitoring differential expression of several genes in first Bacillus
PT cell relative to expression of same genes in one or more second Bacillus
PT cells, by using substrate containing Bacillus genomic sequenced tag
PT array.
XX
PS Claim 11; SEQ ID NO 6689; 200pp; English.

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cell relative to expression of the same genes in one or more second Bacillus cells. The method is useful for monitoring global expression of several genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions, environmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available. This sequence represents a genomic sequence tag (GST) used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT Predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells.
XX
PS Claim 1; SEQ ID NO 1422; 239pp; English.

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the global changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the hepatotoxicity of a compound, comprising detecting the level of expression in a tissue or cell sample exposed to the compound of two or more genes listed in the specification, where differential expression of the genes is indicative of at least one toxic effect or progression. The method can also be used to identify an agent which modulates the toxic response and predict cellular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer

CC system comprising a database containing information identifying the
 CC expression level in a tissue or cell sample exposed to a hepatotoxin of a
 CC set of genes comprising at least two genes listed in the specification,
 CC and a user interface to view the information used to present information
 CC identifying the expression level in a tissue or cell of at least one gene
 CC listed in the specification. The method is useful for elucidating global
 CC changes in gene expression and for identifying toxicity markers in
 CC tissues or cell exposed to a known toxin. The genes may be used as
 CC toxicity markers in drug screening and toxicity assays. The genes and
 CC gene expression information may be used as diagnostic markers for the
 CC prediction or identification of the physiological state of tissue or cell
 CC sample that has been exposed to a compound or agent. Hepatotoxicity is
 CC characterised by centrilobular necrosis and steatosis. The present
 CC sequence is an expressed sequence tag (EST) or cDNA derived from a gene
 CC which is differentially expressed in response to a hepatotoxic agent

XX Predicting a toxic effect of a compound, useful in identifying toxicity

PT markers in liver tissues or cells for drug screening and toxicity assays,

PT comprises preparing gene expression profile of tissue or cells exposed to

PT the compound.

XX Claim 1; SEQ ID NO 3678; 1156pp; English.

XX The present invention relates to a method for predicting a toxic effect

CC of a compound. The method comprises preparing a gene expression profile

CC of a tissue or cell sample exposed to the compound, and comparing the
 CC gene expression profile to a database comprising SEQ ID 1-4925, where
 CC differential expression of the gene indicates at least one toxic effect.
 CC The method is useful for predicting at least one toxic effect of a
 CC compound, predicting hepatotoxicity or the progression of a toxic effect
 CC of a compound, identifying an agent that modulates the onset or
 CC progression of a toxic response, predicting the cellular pathways that a
 CC compound modulates in a cell, and identifying an agent that modulates at
 CC least one activity of a protein. The method and compositions of the
 CC present invention using a database of genes having liver toxin-induced
 CC differential expression, are useful in identifying toxicity markers in
 CC liver tissues or cells for drug screening and toxicity assays. Note: The
 CC sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequences.

DEFINITION

Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15
Contains a single stranded DNA binding protein pseudogene, the TPBG
gene for trophoblast glycoprotein (5T4-AG) and a CpG island,
complete sequence.

COMMENT

1 (bases 1 to 121909)
Garner, P.
Direct Submission
Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vegas@sanger.ac.uk
Clone requests: clonerequest@sanger.ac.uk
On Dec 15, 2000 this sequence version replaced gi:11558491.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em; EMBL; Sw; SWISSPROT; Tr; TREMBL; Wp; WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr6
RP3-492P14 is from the library RPi-3 constructed by the group of
Pieter de Jong. For further details see
http://www.chori.org/bacpac/home.htm
VECTOR: pCYPAC2

Center: Wellcome Trust Sanger Institute

Center code: SC

Web site: <http://www.sanger.ac.uk>

Contact: vegas@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one subclone, and the assembly was confirmed by restriction digest,
except on the rare occasion of the clone being a YAC.

 Rat Genome Sequencing Consortium.
 Direct Submission
 Submitted (20-NOV-2002) Human Genome Sequencing Center, Department
 of Molecular and Human Genetics, Baylor College of Medicine, One
 Baylor Plaza, Houston, TX 77030, USA
 The sequence in this assembly is a combination of BAC based reads
 and whole genome shotgun sequencing reads assembled using Atlas
 (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described
 in the feature table below represents a scaffold in the Atlas
 assembly (a 'contig-scaffold'). Within each contig-scaffold,
 individual sequence contigs are ordered and oriented, and separated
 by sized gaps filled with Ns to the estimated size. The sequence
 may extend beyond the ends of the clone and there may be sequence
 contigs within a contig-scaffold that consist entirely of whole
 genome shotgun sequence reads. Both end sequences and whole genome
 shotgun sequence only contigs will be indicated in the feature
 table.

 Center project name: KZ1Q
 Center clone name: CH230-unknown
 ----- Summary Statistics
 Assembly program: Phrap; version 0.990329
 Consensus quality: 149899 bases at least Q40
 Consensus quality: 155975 bases at least Q30
 Consensus quality: 160292 bases at least Q20
 Estimated insert size: 153789; sum-of-contigs estimation
 Quality coverage: 4x in Q20 bases; sum-of-contigs estimation

 * NOTE: Estimated insert size may differ from sequence length
 * (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
 * consists of 6 contigs. The true order of the pieces
 * is not known and their order in this sequence record is
 * arbitrary. Gaps between the contigs are represented as
 * runs of N, but the exact sizes of the gaps are unknown.
 * This record will be updated with the finished sequence
 * as soon as it is available and the accession number will
 * be preserved.
 * 1 40744: contig of 40744 bp in length
 * 40745 40844: gap of unknown length
 * 40845 180556: contig of 139712 bp in length
 * 180557 180656: gap of unknown length

* 180657 182042: contig of 1386 bp in length
 * 182043 182142: gap of unknown length
 * 182143 183473: contig of 1331 bp in length
 * 183474 183573: gap of unknown length
 * 183574 183575: contig of 1737 bp in length
 * 183576 185410: gap of unknown length
 * 185411 187783: contig of 2373 bp in length.

Cow Genome Sequencing Consortium.

Direct Submission
Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Jun 28, 2005 this sequence version replaced gi:60498847.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Summary Statistics
Assembly program: Atlas 3.0;
Consensus quality: 212622 bases at least Q40
Consensus quality: 214515 bases at least Q30
Consensus quality: 216171 bases at least Q20
Estimated insert size: 216549; sum-of-contigs estimation
Quality coverage: 5x in Q20 bases, sum-of-contigs estimation

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 Rat Genome Sequencing Consortium.
 Direct Submission
 Submitted (10-MAY-2003) Human Genome Sequencing Center, Department
 of Molecular and Human Genetics, Baylor College of Medicine, One
 Baylor Plaza, Houston, TX 77030, USA
 On May 10, 2003 this sequence version replaced gi:23269154.
 The genome in this assembly is a combination of BAC based reads
 and whole genome shotgun sequencing reads assembled using Atlas
 (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
 in the feature table below represents a scaffold in the Atlas
 assembly (a 'contig-scaffold'). Within each contig-scaffold,
 individual sequence contigs are ordered and oriented, and separated
 by sized gaps filled with Ns to the estimated size. The sequence
 may extend beyond the ends of the clone and there may be sequence
 contigs within a contig-scaffold that consist entirely of whole
 genome shotgun sequence reads. Both end sequences and whole genome
 shotgun sequence only contigs will be indicated in the feature
 table.

----- Genome Center
 Center: Baylor College of Medicine
 Center code: BCM
 Web site: http://www.hgsc.bcm.tmc.edu/
 Contact: hgsc-help@bcm.tmc.edu
 ----- Project Information
 Center project name: GGOA
 Center clone name: CH230-111N19
 ----- Summary Statistics
 Assembly program: Atlas 3.0;
 Consensus quality: 242457 bases at least Q40
 Consensus quality: 247377 bases at least Q30
 Consensus quality: 250200 bases at least Q20
 Estimated insert size: 248371; sum-of-contigs estimation
 Quality coverage: 6x in Q20 bases; sum-of-contigs estimation

 NOTE: Estimated insert size may differ from sequence length
 (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
 NOTE: This is a 'working draft' sequence. It currently
 consists of 17 contigs. The true order of the pieces
 is not known and their order in this sequence record is
 arbitrary. Gaps between the contigs are represented as
 runs of N, but the exact sizes of the gaps are unknown.
 This record will be updated with the finished sequence
 as soon as it is available and the accession number will
 be preserved.

TITLE Initial Sequence of the Chimpanzee Genome and Comparison with the
JOURNAL Human Genome
COMMENT Unpublished (2005)
Contact: Michael C. Zody
Broad Institute of MIT and Harvard
320 Charles Street, Cambridge, MA 02141, USA
Tel: 6172580933
Fax: 6172580903
Email: mczody@broad.mit.edu
Primer A: No sequence submitted
Primer B: No sequence submitted
STS size: 701
Protocol:
23,021,928 chimpanzee whole genome shotgun reads were aligned to
the Human genome NCBI
Build 34 (hg16, July 2003). Chimp WGS reads were from 9 donors,
including Clint (Pan
troglodytes verus), 3 other Pan troglodytes verus chimps
(Donald, Karlén, Yvonne), 3 Pan
troglodytes troglodytes chimps (Noémie, Masuku, Clara) and 2 chimps
of unknown origin
(Gon, Unknown Chimp). Common names: Pan troglodytes verus is the
western chimp and Pan
troglodytes troglodytes is the central chimp. To be included in
chimpanzee SNP discovery, a
read must be at least 500bp in length, at least 50% of its base
calls must have Phred
score >= 20, at least 30% of its base calls must satisfy
SNQS(30,25) (single strand NQS, the
base in question has Phred score >= 30, the surrounding 10 bases in
the read have Phred
score >= 25), and the read must have at least 200 bp SNQS(30,25)
bases. Reads not uniquely
placed in the genome and read pairs whose two ends were not
consistently placed were
discarded. After above filtering, NQS(30,25) standard was applied
to all pairs of
overlapping reads to call NQS bases and SNPs. Alignments (between
two reads) with less
than 100 NQS bases or with SNP rate > 0.01 were discarded. To
exclude alignment between two
copies of a single read, comparisons between two reads that share
95% of their genome
alignments (>=95% bases of read A and >=95% bases of read B were
placed at the same locus
of human genome) were discarded.

NOTICE: This sequence may not be the entire insert of this clone.
 It may be shorter because we only sequence overlapping sections
 once, or longer because we provide a small overlap between
 neighboring submissions.

This sequence was finished as follows unless otherwise noted: all
 regions were double stranded, sequenced with an alternate chemistry
 or covered by high quality data (i.e., phred quality >= 30); an
 attempt was made to resolve all sequencing problems, such as
 compressions and repeats; all regions were covered by sequence from
 more than one ml3 subclone.

For a graphical representation of this clone sequence and its
 analysis see:

http://www.wormbase.org/db/seq/sequence?name=K04F10;class=Sequence

NEIGHBORING CLONE INFORMATION

The 5' clone is F26B1, 200 bp overlap; the 3' clone is ZC308, 600
 bp overlap. Actual start of this clone is at base position 23932 of
 F26B1; actual end is at 4388 of ZC308.

NOTES:

Coding sequences below are the result of integration and manual
 review of the following data : computer analysis using the program
 Genefinder (P. Green and L. Hillier, personal communication), the
 large scale EST projects of Yuji Kohara
 (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The C.
 elegans ORFeome cloning project (http://wofldb.dfci.harvard.edu/),
 similarity to other proteins from BlastX analyses
 (http://blast.wustl.edu/), sequence conservation with C. briggsae
 using Jim Kent's WABA alignment program (Genome Research
 10:1115-1125, 2000), individual C. elegans GenBank submissions,
 and personal communications with C. elegans researchers. tRNAs
 are predicted using the program tRNAscan-SE (Lowe, T.M. and
 Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

 ----- Project Information

 Center project name: llw
 Center clone name: 239102

The sequence data in this record represents an 'enhanced'
 version of a Phase 2 submission. Specifically, the indicated
 order and orientation of each sequence contig has been
 established using one or more of the following: read-pair
 data from individual subclones, overlaps with neighboring
 clones, alignment with available reference sequence (e.g.,
 human), and/or confirmation by PCR testing. In addition,
 the sequence assembly is generally based on at least 8X average
 coverage in Q20 bases and has been reviewed to rule out
 gross misassemblies, the low-quality ends of sequence
 contigs have been trimmed away, and each base is associated
 with a Phrap-derived quality score.

----- Summary Statistics
 Sequencing vector: plasmid; n/a; 100% of reads
 Chemistry: Dye-terminator Big Dye; 100% of reads
 Assembly program: Phrap; version 0.990319
 Consensus quality: 187477 bases at least Q40
 Consensus quality: 187640 bases at least Q30
 Consensus quality: 187774 bases at least Q20
 Insert size: 189000; agarose-fp
 Insert size: 187854; sum-of-contigs
 Quality coverage: 9.31x in Q20 bases; agarose-fp
 Quality coverage: 9.37x in Q20 bases; sum-of-contigs

 * NOTE: This is a 'working draft' sequence. It currently
 * consists of 5 contigs. Gaps between the contigs
 * are represented as runs of N. The order of the pieces
 * is believed to be correct as given, however the sizes
 * of the gaps between them are based on estimates that have
 * been provided by the submitter.

* This sequence will be replaced
 * by the finished sequence as soon as it is available and
 * the accession number will be preserved.
 * 1 18794: contig of 18794 bp in length
 * 18795 18894: gap of unknown length
 * 18895 56668: contig of 37774 bp in length
 * 56669 56768: gap of unknown length
 * 56769 80395: contig of 23627 bp in length
 * 80396 80495: gap of unknown length
 * 80496 169236: contig of 88741 bp in length
 * 169237 169336: gap of unknown length
 * 169337 188254: contig of 18918 bp in length.

coverage: 9.70x in Q20 bases; agarose-fp

* NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

* 1 130645: contig of 130645 bp in length
 * 130646 130745: gap of 100 bp
 * 130746 130747: contig of 92632 bp in length
 * 223377 223378: gap of 100 bp
 * 223378 226256: contig of 2779 bp in length
 * 226257 226356: gap of 100 bp
 * 226357 229095: contig of 2739 bp in length
 * 229096 229196: gap of 100 bp
 * 229196 231264: contig of 2069 bp in length.

 Contact: vegas@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone, and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

XX PT A method, useful for prognosing and treating solid tumor, comprises
XX PT comparing an expression profile of a gene expressed in peripheral blood
XX PT mononuclear cells to a reference expression profile of a gene.
XX PS Disclosure; Page; 111pp; English.
XX XX The invention describes a method comprising comparing an expression
XX CC profile of at least one gene in a peripheral blood sample of a patient to
XX CC at least one reference expression profile of the at least one gene, where
XX CC the patient has a solid tumour, and each of the gene is differentially
XX CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
XX CC of patients as compared to PBMCs of a second class of patients, where
XX CC both the first and second classes of patients have the solid tumour, and
XX CC each of the first and second classes is a subcluster formed by an
XX CC unsupervised clustering analysis of gene expression profiles in PBMCs of
XX CC a population of patients who have the solid tumour, and where the
XX CC majority of the first class of patients has a first clinical outcome, and
XX CC the majority of the second class of patients has a second clinical
XX CC outcome. Also described are: a system comprising (i) a memory or a
XX CC storage medium including data that represent an expression profile of at
XX CC least one gene in a peripheral blood sample of a patient who has a solid
XX CC tumour, (ii) at least another storage medium including data that
XX CC represent at least one reference expression profile of the gene, (iii) a
XX CC program capable of comparing the expression profile to the reference
XX CC expression profile, and (iv) a processor capable of executing the
XX CC program, where expression levels of the gene in peripheral blood
XX CC mononuclear cells of patients who have the solid tumour correlate with
XX CC clinical outcomes of the patients; and a nucleic acid or protein array
XX CC comprising concentrated probes for solid tumour prognosis genes, where
XX CC each of the solid tumour prognosis genes is differentially expressed in
XX CC PBMCs of a first class of patients as compared to PBMCs of a second class
XX CC of patients, where both the first and second classes of patients have a
XX CC solid tumour, and where the first class of patients has a first clinical
XX CC outcome, and the second class of patients has a second clinical outcome.
XX CC The method, system, and array are useful for prognosing and treating
XX CC solid tumours. This sequence represents a solid tumour prognosis gene of
XX CC the invention. Note: The sequence data for this patent did not form part
XX CC of the printed specification, but was obtained in electronic format
XX CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

XX PT Detecting a breast cancer-associated transcript in a patient's cell,
XX PT useful for diagnosing breast cancer, comprises contacting a biological
XX PT sample with a polynucleotide that selectively hybridizes with breast
XX PT cancer nucleic acids.
XX PS Claim 9; Page 372; 414pp; English.
XX CC The invention comprises a method of detecting a breast cancer-associated
XX CC transcript in a cell from a patient. The method of the invention involves
XX CC contacting a biological sample from the patient with a nucleotide that
XX CC hybridises to one of the 69 breast cancer-associated gene sequences shown
XX CC in the specification. The method of the invention is useful in the
XX CC diagnosis or prognosis of breast cancer, and for detecting genes that are
XX CC up or down-regulated in breast cancer cells. Genes identified by the
XX CC method of the invention can be used in diagnostic purposes and also as
XX CC targets for screening for therapeutic compounds that modulate breast
XX CC cancer (e.g. hormones or antibodies). Identification of genes that are
XX CC over or under expressed in breast cancer can additionally provide high-
XX CC resolution, high-sensitivity datasets which can be used in the areas of
XX CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
XX CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
XX CC represent the 69 breast cancer-associated gene sequences of the invention

XX FT patient with a polynucleotide that exhibits increased or decreased
XX FT expression in lung cancer.

XX PS Claim 22; Page 336; 453pp; English.

XX CC The invention relates to a method for detecting a lung cancer-associated
XX CC transcript in a cell from a patient, comprising contacting a biological
XX CC sample from the patient with a polynucleotide that selectively hybridizes
XX CC to a sequence that is at least 80 % identical to a gene that exhibits
XX CC increased or decreased expression in lung cancer samples. Lung cancer-
XX CC associated polynucleotides and polypeptides are used for identifying a
XX CC compound that modulates a lung cancer-associated polypeptide, for
XX CC inhibiting proliferation of a lung cancer-associated cell to treat lung
XX CC cancer in a patient and for treating a mammal having lung cancer by
XX CC administering a modulatory compound identified. The methods are useful
XX CC for treating lung cancer, such as small cell lung cancer, non-small cell
XX CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
XX CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
XX CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
XX CC bronchiectasis. The genes, polynucleotides and polypeptides are useful

CC for diagnostic purposes and as targets for screening for therapeutic
CC compounds that modulate lung cancer, such as antibodies. Sequences
CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
CC invention

XX FT Detecting an ovarian cancer-associated transcript in a cell from a
XX FT patient, comprises contacting a biological sample from the patient with a
XX FT polynucleotide that hybridizes to an ovarian cancer gene.

XX PS Claim 10; Page 297; 332pp; English.

XX CC The invention relates to a method of detecting an ovarian cancer-
XX CC associated transcript in a cell from a patient, by contacting a
XX CC biological sample from the patient with a polynucleotide that selectively
XX CC hybridizes to a sequence at least 80% identical to any of one of 80
XX CC nucleic acid sequences given in the specification. The method is useful
XX CC in diagnosing ovarian cancer and in identifying and using agents and/or
XX CC targets that inhibit ovarian cancer. The nucleic acid molecule,

CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

XX Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.

XX Claim 8; SEQ ID NO 41; 1385pp; English.

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

 XX Identifying a candidate p53 pathway-modulating agent for treating cancer
 PT comprises contacting an assay system comprising a purified leucine rich
 PT repeat, capricious related polypeptide or nucleic acid with a test agent.
 XX Example 5; Page 74-75; 99pp; English.
 XX The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

 XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 PT disorders, and asthma.
 XX

PS Claim 16; Page 114-115; 61pp; English.

XX The present invention relates to new isolated proteins (NOVX) and their

CC coding sequences (ABV9327-ABV99595 and ABP70049-ABP70149), where X is

CC any number from 1 to 48. The NOVX proteins and coding sequences are

CC useful in the manufacture of a medicament for treating a syndrome

CC associated with a human disease, preferably a NOVX-associated disorder.

CC The NOVX coding sequences and proteins are useful for treating,

CC preventing or diagnosing diseases such as metabolic disorders, diabetes,

CC obesity, infectious disease, anorexia, cancer-associated cachexia,

CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's

CC disease, immune disorders, haematopoietic disorders, cardiovascular

CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic

CC disturbances associated with obesity, metabolic syndrome X or wasting

CC disorders associated with chronic diseases or various cancers. The NOVX

CC coding sequences and proteins may also be used as targets for the

CC identification of small molecules that modulate or inhibit e.g.

CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,

CC wound healing and angiogenesis, in gene therapy, in generation of

CC antibodies that bind immunospecifically to NOVX substances for use in

CC therapeutic or diagnostic methods

PT Novel canine or feline 5T4 polypeptide and polynucleotides encoding the

PT polypeptide, useful in preparation of vaccine for treating and/or

PT preventing cancer in a subject, preferably a dog or cat.

XX

PS Claim 4; Page 68; 68pp; English.

XX

CC The present invention relates to the isolation of canine and feline

CC oncofoetal leucine-rich glycoproteins known as 5T4, and the

CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in

CC a significant proportion of tumours. The sequences of the invention are

CC useful in a pharmaceutical composition for the prevention and/or

CC treatment of tumours or other diseases associated with cell

CC proliferation, infections, and inflammatory conditions in animals,

CC preferably dogs or cats. The compositions may also be used for cancer

CC immunotherapy in these animals. The sequences of the invention may also

CC be used in diagnostic kits for rapid, reliable, sensitive, and specific

CC measurement and localisation of 5T4 in extracts of plasma, urine,

CC tissues, and in cell culture media. Antibodies specific for the 5T4

CC protein are useful for isolating foetal cells from maternal blood. The

CC isolation process may form part of a diagnostic method e.g. the foetal

CC cells may then be subject to biochemical or genetic sampling used for

CC testing foetal abnormalities, or to determine the sex of the foetus(es).

CC The present sequence encodes feline 5T4 protein

 CC The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope; a polypeptide of the
 CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/or its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

XX
XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
PT response useful in vaccinating against and in treating tumors.
XX
XX Example 2; Page 78; 79pp; English.
XX
XX The present sequence encodes the human 5T4 tumour-associated antigen
CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject

XX Myers K, Drury N, Carroll M;
XX WPI; 2002-557449/59.
XX P-PSDB; AAU98693.
XX Novel canine or feline 574 polypeptide and polynucleotides encoding the
XX polypeptide, useful in preparation of vaccine for treating and/or
XX preventing cancer in a subject, preferably a dog or cat.
XX Claim 1; Page 67; 68pp; English.
XX The present invention relates to the isolation of canine and feline
XX oncofoetal leucine-rich glycoproteins known as 574, and the
XX polynucleotide sequences encoding them. The 574 proteins are expressed in
XX a significant proportion of tumours. The sequences of the invention are
XX useful in a pharmaceutical composition for the prevention and/or
XX treatment of tumours or other diseases associated with cell
XX proliferation, infections, and inflammatory conditions in animals,
XX preferably dogs or cats. The compositions may also be used for cancer
XX immunotherapy in these animals. The sequences of the invention may also
XX be used in diagnostic kits for rapid, reliable, sensitive, and specific
XX measurement and localisation of 574 in extracts of plasma, urine,
XX tissues, and in cell culture media. Antibodies specific for the 574
XX protein are useful for isolating foetal cells from maternal blood. The
XX isolation process may form part of a diagnostic method e.g. the foetal
XX cells may then be subject to biochemical or genetic sampling used for
XX testing foetal abnormalities, or to determine the sex of the foetus(es).
XX The present sequence encodes canine 574 protein

PS
CC The invention relates to a method of identifying a candidate p53 pathway
CC modulating agent. The method involves contacting an assay system
CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
CC polypeptide or nucleic acid or its fragment with a test agent and
CC detecting a test agent-biased activity, where a difference between the
CC test agent-biased activity and the reference activity identifies the test
CC agent as a candidate p53 pathway modulating agent. The method is useful
CC for identifying a candidate p53 pathway-modulating agent for preparing a
CC composition for diagnosing or treating cancer. The invention is useful in
CC gene therapy. The present sequence is human LRRCAPS related DNA

DR New genes regulated by MYCN activation, useful in gene therapy,
XX particularly for treating a subject with e.g. neuroblastoma or other
PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.
XX
PS Claim 1; SEQ ID NO 105; 27pp; English.
XX
XX This invention relates to novel isolated cDNAs that are differentially
CC expressed in MYCN activated cells. Specifically, it refers to

CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an
CC exemplification of the invention. NOTE: This sequence does not appear in
CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009.

DR Detecting a bladder cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT bladder cancer-associated polynucleotide or antibody.
XX
PS Claim 6; Page 296; 307pp; English.
XX
XX The present invention describes a method for detecting a bladder cancer-
CC associated transcript in a cell from a patient. The method comprises

CC contacting a biological sample from the patient with a polynucleotide
 CC that selectively hybridizes to a sequence that is 80 % identical to a
 CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
 CC encode the human bladder cancer-associated proteins given in ABR48146 to
 CC ABR48242). Bladder cancer-associated sequences from the present invention
 CC have cytostatic activities, and can be used in antisense gene therapy and
 CC in vaccine production. The method can be used for detecting a bladder
 CC cancer-associated transcript in a cell from a patient. The method is
 CC useful in diagnosing or treating bladder cancer and in screening for
 CC compounds that modulate bladder cancer, such as hormones or antibodies.
 CC The nucleic acid molecules from the present invention may be used in
 CC various screening and diagnostic methods, and for gene therapy, vaccine
 CC and/or antisense/inhibition applications

XX Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.

PS Claim 22; Page 335; 453pp; English.

XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX Determining the presence or absence of a pathological cell in a patient,

PT useful for diagnosing, prognosing or treating cancer, comprises detecting

PT a nucleic acid in a biological sample.

XX Claim 9; SEQ ID NO 39; 1385pp; English.

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

CC whose expression is upregulated or downregulated in specific cancers or

CC other diseases such as angiogenic or fibrotic disorders, and to methods

CC of determining the presence or absence of a pathological cell in a

CC patient by detecting a nucleic acid at least 80% identical to those of

CC the invention or by detecting a polypeptide of the invention. The

CC invention also relates to expression vectors and host cells comprising a

CC nucleic acid of the invention; antibodies which specifically bind a

CC polypeptide of the invention; use of such antibodies for drug targeting;

CC and methods of screening for modulators of activity or expression of the

CC polypeptides and nucleic acids. The nucleic acids, polypeptides,

CC antibodies and methods are useful for diagnosing, prognosing and treating

CC cancer and other conditions such as psoriasis, ischaemia, heart disease,

CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal

CC neovascularisation syndromes, scarring and uterine fibroids. They may

CC also be useful in wound healing and in contraception. The present

CC sequence represents a nucleic acid sequence of the invention.

XX New antibody that binds to a tumor-associated antigenic target (TAT)

PT polypeptide, useful for preparing a composition for diagnosing or

PT treating cancer.

XX Claim 1; SEQ ID NO 53; 319pp; English.

XX The present invention relates to the isolation of human tumour-associated

CC antigenic target (TAT) polynucleotide and polypeptide sequences. Also

CC disclosed is an antibody that binds to a TAT polypeptide. The antibody is

CC a monoclonal antibody, an antibody fragment, a chimeric antibody or a

CC humanised antibody. It is conjugated to a growth inhibitory agent. It is

CC produced in bacteria or in CHO cells and induces death of a cell to which

CC it binds. The antibody is useful for preparing a composition for

CC diagnosing or treating tumours and cancer. The present sequence

CC represents a human TAT cDNA sequence of the invention.

XX PT New tumor-associated antigenic target polypeptides and nucleic acids,
 PT useful in preparing a medicament for treating or detecting a
 PT proliferative disorder, e.g. breast, lung, colorectal, ovarian or
 PT prostate cancer or tumor.

XX PS Claim 1; SEQ ID NO 2070; 7273pp; English.

XX CC The invention relates to human tumour-associated antigenic target (TAT)
 CC polypeptides, and their related nucleic acids. The TAT polypeptides are
 CC overexpressed in cancer tissues compared to normal tissues, and may thus
 CC serve as effective targets for the diagnosis and treatment of cancer in
 CC mammals. The invention also relates to nucleic acid and polypeptide
 CC sequences at least 80% identical to the TAT nucleic acids and
 CC polypeptides; expression vectors and host cells comprising a TAT nucleic
 CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
 CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
 CC TAT polypeptide; and methods and compositions for the treatment or
 CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
 CC antibodies, antagonists, binding molecules and compositions are useful
 CC for diagnosing or treating a cell proliferative disorder associated with
 CC increased TAT expression, particularly cancers such as breast cancer,
 CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
 CC cancer, pancreatic cancer, cervical cancer, cancers of the central
 CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
 CC used as hybridisation probes, in chromosome and gene mapping, in
 CC chromosome identification and in gene therapy. The present sequence
 CC represents a TAT nucleic acid of the invention

XX Identifying a compound that can treat disease or disorders, such as, a
 PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
 PT determining the expression of one or more efficacy genes in a cell
 PT contacted with the test compound.

XX Example 6; SEQ ID NO 174; 39pp; English.

XX This invention relates to a novel screening method identified as a multi-
 CC parameter high throughput screening (MPHTS) assay. Specifically, it
 CC refers to an assay that utilizes the disease signature of a plurality of
 CC specific genes associated with a particular disease, and identifies
 CC differential expression between those cells taken from individuals
 CC affected by that disease and those that are not affected. The present
 CC invention then describes the screening of candidate pharmaceutical
 CC compounds to identify those that have a potential therapeutic benefit for
 CC the treatment of neuropsychiatric and neurodegenerative disorders
 CC including schizophrenia, bipolar affective disorder (BAD) and autism, as
 CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
 CC of this invention exhibit various activities including neuroleptic,

CC nootropic, antimanic and antidepressant. Furthermore, the screening
 CC method used in MPHTS will be automated, such that a large number of test
 CC compounds may be rapidly screened with a minimal amount of labour and
 CC effort. This polynucleotide is a human cDNA sequence of a gene that is
 CC differentially expressed in the presence of a therapeutic compound and
 CC represents an exemplary efficacy gene for bipolar affective disorder,
 CC given in an exemplification of the invention.

XX New isolated polynucleotide and encoded polypeptides, useful in
 PT diagnostics, forensics, gene mapping, identification of mutations
 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.

XX Claim 1; SEQ ID NO 22979; 103pp; English.

XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (I) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders

CC Involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have applications in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits to assess biodiversity
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

CC The invention relates to primers for synthesizing full length cDNA
 CC clones. 830 cDNA molecules encoding a human protein have been isolated
 CC and nucleotide sequences of 5' and 3' ends of the cDNA molecules have
 CC been determined. Primers for synthesizing the full length cDNA are useful
 CC for clarifying the function of the protein encoded by the cDNA. The full
 CC length clones were obtained by construction of full length enriched cDNA
 CC libraries that were synthesised by the oligo-capping method. The primers
 CC enable the production of the full length cDNA easily without any special
 CC methods. The present sequence is a full length human cDNA of the

CC invention. Note: The sequence data for this patent did not form part of
 CC the printed specification, but was obtained in CD-ROM format directly
 CC from EPO

XX Example 1; SEQ ID NO 2864; 1340pp; English.

CC This invention relates to a novel primers useful for synthesizing full
 CC length cDNA molecules that encode human proteins. Specifically, it refers
 CC to secretory or membrane proteins that are potential therapeutic agents/
 CC target molecules in the field of medicine, and in particular genes
 CC encoding proteins that are associated with signal transduction,
 CC glycoproteins and transcription. The present invention describes a method
 CC for efficiently cloning a full length human cDNA from both the 5' and 3',
 CC ends using the oligo-capping method. This polynucleotide sequence is a
 CC full length human cDNA clone of the invention.

XX New signal transducer and activator of transcription 6 activation

PT promoting purified protein, for diagnosing and treating disease

PT associated with activation/inhibition of transcription factor e.g.

PT diabetes and cancer.

XX Claim 4; SEQ ID NO 127; 1368pp; English.

XX The invention relates to a purified protein promoting signal transducer

XX and activator of transcription 6 activation (STAT6). The protein is

XX useful for the producing an antibody, which involves administering the

XX protein or its epitope-bearing fragments to a non-human animal as an

XX antigen. The nucleic acid is useful for diagnosing a disease or

XX susceptibility to a disease related to expression or activity of the

XX protein. A transformant expressing the protein is useful for screening

XX compounds which inhibit or promote STAT6 activation. A transformant

XX expressing the protein is useful for producing a pharmaceutical

XX composition. Compositions, antibodies and antisense molecules are useful

XX for the treating a disease associated with STAT6 activation such as

XX allergic diseases, inflammation, autoimmune diseases, diabetes,

XX hyperlipidaemia, infections disease and cancers. Compositions are useful

XX for treating disease associated with STAT6 activation and/or prevention

XX of Th1 hyperactive diseases. Compositions are also useful in rheumatoid

XX arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,

XX allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,

XX viral hepatitis and AIDS. The protein has effectively useful for screening

XX activity. The protein or nucleic acid is effectively useful for screening

XX compounds for treating and preventing disease associated with excessive

XX activation or inhibition of STAT6. The present sequence represents a

XX human cDNA encoding a protein which promotes STAT6 activation.

The invention relates to a purified protein promoting signal transducer
 and activator of transcription 6 activation (STAT6). The protein is
 useful for the producing an antibody, which involves administering the
 protein or its epitope-bearing fragments to a non-human animal as an
 antigen. The nucleic acid is useful for diagnosing a disease or
 susceptibility to a disease related to expression or activity of the
 protein. A transformant expressing the protein is useful for screening

XX PT Monitoring differential expression of several genes in first Bacillus
XX PT cell relative to expression of same genes in one or more second Bacillus
XX PT cells, by using substrate containing Bacillus genomic sequenced tag
XX PT array.
XX PS Claim 11; SEQ ID NO 6412; 200pp; English.
XX CC The invention describes a method of monitoring differential expression of
XX CC genes in a first Bacillus cell relative to expression of the genes in
XX CC other Bacillus cells, comprising hybridising labelled nucleic acid probes
XX CC isolated from Bacillus cells to a substrate containing array of Bacillus
XX CC genomic sequenced tags (GST), examining the array, and determining
XX CC relative gene expression by an observed hybridisation reporter signal of
XX CC a spot in the array. The method is useful for measuring the expression of
XX CC genes in a first Bacillus cell relative to expression of the same genes
XX CC in one or more second Bacillus cells. The method is useful for monitoring
XX CC global expression of several genes from a Bacillus cell, discovering new
XX CC genes, identifying possible functions of unknown open reading frames and
XX CC monitoring gene copy number variation and stability. Monitoring changes
XX CC in expression of genes may be used to provide a representation of the way
XX CC in which Bacillus cells adapt to changes in culture conditions,
XX CC environmental stress or other physiological provocation. Extensive follow
XX CC -up characterisation is unnecessary, when one spot on an array equals one
XX CC gene or one open reading frame, since sequence information is available.
```

 PT benthamiana plants, useful for altering the levels of metabolites e.g.
 PT acids, fatty acids, amino acids, carbohydrates, hydrocarbons and sterols.

XX PS Claim 1; SEQ ID NO 1150; 2576pp; English.

XX CC The invention comprises DNA sequences which confer an altered metabolic
 CC characteristic when they are expressed in a plant. The DNA sequences of
 CC the invention are useful for producing plants with an altered metabolic
 CC characteristic, such as: altered acid metabolism, alcohol metabolism,
 CC fatty acid metabolism, branched fatty acid metabolism, alkaloid or other
 CC base metabolism, altered amino acid metabolism, altered ester metabolism,
 CC altered glyceride metabolism, altered phenolic metabolism, altered
 CC carbohydrate metabolism, altered sterol, oxygenated terpene, or
 CC isoprenoid metabolism, alkene or alkyne metabolism, hydrocarbon
 CC metabolism, ketone or quinone metabolism. The DNA sequences of the
 CC invention may be used to provide disease resistance in a plant and gene
 CC shuffling or sexual PCR procedures. The present nucleic acid represents a
 CC DNA sequence of the invention.

PT Monitoring differential expression of several genes in first Bacillus

PT cell relative to expression of same genes in one or more second Bacillus

PT cells, by using substrate containing Bacillus genomic sequenced tag

PT array.

XX

XX

PS Claim 11; SEQ ID NO 6460; 200pp; English.

XX

XX

CC The invention describes a method of monitoring differential expression of

CC genes in a first Bacillus cell relative to expression of the genes in

CC other Bacillus cells, comprising hybridising labelled nucleic acid probes

CC isolated from Bacillus cells to a substrate containing array of Bacillus

CC genomic sequenced tags (GST), examining the array, and determining

CC relative gene expression by an observed hybridisation reporter signal of

CC a spot in the array. The method is useful for measuring the expression of

CC genes in a first Bacillus cell relative to expression of the same genes

CC in one or more second Bacillus cells. The method is useful for monitoring

CC global expression of several genes from a Bacillus cell, discovering new

CC genes, identifying possible functions of unknown open reading frames and

CC monitoring gene copy number variation and stability. Monitoring changes

CC in expression of genes may be used to provide a representation of the way

CC in which Bacillus cells adapt to changes in culture conditions,

CC environmental stress or other physiological provocation. Extensive follow

CC -up characterisation is unnecessary, when one spot on an array equals one

CC gene or one open reading frame, since sequence information is available.

CC This sequence represents a genomic sequence tag (GST) used in the method

CC of the invention. Note: The sequence data for this patent did not form

CC part of the printed specification, but was obtained in electronic format

CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

CC The invention relates to an isolated nucleic acid comprising any one of

CC the 6213 antisense sequences given in the specification where expression

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid

CC encoding a polypeptide whose expression is inhibited by the antisense

CC nucleic acid; (2) a host cell containing the vector; (3) an isolated

CC polypeptide or its fragment whose expression is inhibited by the

CC antisense nucleic acid; (4) an antibody capable of specifically binding

CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

CC proliferation or the activity of a gene in an operon required for

CC proliferation; (7) identifying a compound that influences the activity of

CC the gene product or that has an activity against a biological pathway (8)

CC required for proliferation, or that inhibits cellular proliferation; (8)

CC identifying a gene required for cellular proliferation or the biological

CC pathway in which a proliferation-required gene or its gene product lies

CC or a gene on which the test compound that inhibits proliferation of an

CC organism acts; (9) manufacturing an antibiotic; (10) profiling a

CC compound's activity; (11) a culture comprising strains in which the gene

CC product is overexpressed or underexpressed; (12) determining the extent

CC to which each of the strains is present in a culture or collection of

CC strains; or (13) identifying the target of a compound that inhibits the

CC proliferation of an organism. The antisense nucleic acids are useful for

CC identifying proteins or screening for homologous nucleic acids required

CC for cellular proliferation to isolate candidate molecules for rational

CC drug discovery programs, or for screening homologous nucleic acids

CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,

CC K. pneumoniae or P. aeruginosa. The present sequence is one of the target
 CC prokaryotic essential genes. Note: The sequence data for this patent did

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Direct Submission
Submitted (03-NOV-2004) Sanger Institute, Hinxton, Cambridgeshire,
CB10 1SA, UK. E-mail enquiries: trop@sanger.ac.uk
COMMENT This sequence is from a Xenopus Gene Collection (XGC) library, from
a library constructed by Aaron M. Zorn. cDNA was prepared from RNA
extracted from gastrula embryos. EcoRI-NotI cut cDNA was then
ligated into pCS107 with EcoRI at the 5' end and NotI at the 3'
end.
Vector: pCS107; Site 1: EcoRI; Site 2: NotI
Host: Escherichia coli XL1-blue.

TITLE NEDO human cDNA sequencing project

JOURNAL Unpublished

REFERENCE 2 (bases 1 to 2359)

AUTHORS Isogai, T. and Otsuki, T.

TITLE Direct Submission

JOURNAL Submitted (25-MAR-2002) Takao Isogai, Helix Research Institute,
Genomics Laboratory; 1532-3 Yana, Kisarazu, Chiba 292-0812, Japan
(E-mail: genomics@hri.co.jp, Tel: 81-438-52-3975, Fax: 81-438-52-3986)

COMMENT NEDO human cDNA sequencing project supported by Ministry of
Economy, Trade and Industry of Japan; cDNA full insert sequencing:
Research Association for Biotechnology; cDNA library construction:
Institute of Medical Science, University of Tokyo, Laboratory of
Genome Structure, Human Genome Center; cDNA 5'- & 3'-end one pass
sequencing and clone selection: Helix Research Institute (supported
by Japan Key Technology Center etc.).

Clone distribution: MGC clone distribution information can be found
 through the I.M.A.G.E. Consortium/ILNL at: <http://image.llnl.gov>
 Series: IRAK Plate: 123 Row: p Column: 18
 This clone was selected for full length sequencing because it
 passed the following selection criteria: matched mRNA gi: 6755854.

-----
This sequence was finished as follows unless otherwise noted: all

```

regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

            -----
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em., EMBL; Sw., SWISSPROT; Tr., TREMBL; Wp., WormPEP; Information
            on the WormPEP database can be found at
            http://www.sanger.ac.uk/Projects/c_elegans/wormpep/Clone-derived
            zebrafish pUC subclones occasionally display inconsistency over the
            length of mononucleotide A/T runs and conserved TA repeats. Where
            this is found the longest good quality representation will be
            submitted.
            Repeat names beginning 'Dr' were identified by the Recon repeat
            discovery system (Zhirong Bao and Sean Eddy, submitted), and those
            beginning 'drr' were identified by Rick Waterman (Stephen Johnson
            lab, WashU). For further information see
            http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml
            CH211-243C14 is from a CHORI-211 BAC library

COMMENT

NOTICE:
This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e. phred quality
>=30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone, fosmid clone or direct clone walk sequence.
Sequence from the Mouse Genome Sequencing Consortium whole genome
shotgun may have been used to obtain the consensus sequence. The

assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous
Human standard. Specifically, standards for regions of low sequence
complexity (such as dinucleotide repeats and small unit tandem
repeats) have been relaxed. These regions are very prevalent in the
mouse genome, and the return on extended finishing efforts is
minimal.

If a sequence meets the criteria of the above statement, it needs
no comments or tags. If the criteria are not met, such as ambiguous
bases, then the region is duly annotated.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren,
Department of Genetics, Washington University, St. Louis MO. For
additional information about the map position of this sequence, see
http://genome.wustl.edu

SOURCE INFORMATION:

The BAC Library has been constructed by Pieter de Jong and
coworkers (http://www.chori.org) from male C57BL/6J mouse spleen
and/or brain genomic DNA. The clone and detailed information can be
obtained from Pieter de Jong and coworkers at http://www.chori.org

This sequence is the entire insert of the clone.

Rat Genome Sequencing Consortium.
Direct Submission
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Nov 19, 2002 this sequence version replaced gi:23265004.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Center clone name: CH240-172A22
----- Summary Statistics
Sequencing vector: Plasmid;
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 93363 bases at least Q40

Consensus quality: 97762 bases at least Q30
Consensus quality: 100227 bases at least Q20
Estimated insert size: 106512; sum-of-contigs estimation
Quality coverage: 1x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 21 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

Center code: SC

Web site: <http://www.sanger.ac.uk>

Contact: zfish-help@sanger.ac.uk

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em.; EMBL; Sw.; SWISSPROT; Tr.; TREMBL; Wp.; WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/projects/C_elegans/wormpep Clone-derived Zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats. Where

this is found the longest good quality representation will be submitted.

Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'dr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml

Contact: zfish-help@sanger.ac.uk

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived Zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be submitted.

Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml CH211-150023 is from a CHORI-211 BAC library

Rat Genome Sequencing Consortium.

Direct Submission

Submitted (13-MAY-2003) Human Genome Sequencing Center, Department
 of Molecular and Human Genetics, Baylor College of Medicine, One
 Baylor Plaza, Houston, TX 77030, USA

The sequence in this assembly is a combination of BAC based reads

and whole genome shotgun sequencing reads assembled using Atlas

(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described

in the feature table below represents a scaffold in the Atlas

assembly (a 'contig-scaffold'). Within each contig-scaffold,

individual sequence contigs are ordered and oriented, and separated

by sized gaps filled with Ns to the estimated size. The sequence

may extend beyond the ends of the clone and there may be sequence

contigs within a contig-scaffold that consist entirely of whole

genome shotgun sequence reads. Both end sequences and whole genome

sequence only contigs will be indicated in the feature

table.

----- Project Information

Center project name: GKMH

Center clone name: CH230-187H10

----- Summary Statistics

Assembly program: Atlas 3.0;

Consensus quality: 197649 bases at least Q40

Consensus quality: 199600 bases at least Q30

Consensus quality: 201081 bases at least Q20

Estimated insert size: 210356; sum-of-contigs estimation

Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length

(see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

consists of 1 contigs. Gaps between the contigs

are represented as runs of N. The order of the pieces

is believed to be correct as given, however the sizes

of the gaps between them are based on estimates that have

provided by the submitter.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* 1 213305; contig of 213305 bp in length.

2 (bases 1 to 271932)
Worley, K. C.
Direct Submission
Submitted (21-OCT-2001) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
3 (bases 1 to 271932)
Rat Genome Sequencing Consortium.
Direct Submission
Submitted (03-OCT-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Sep 14, 2002 this sequence version is replaced gi:21735993.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). As a result, the
sequence may extend beyond the ends of the clone and there may be
contigs that consist entirely of whole genome shotgun sequence
reads. Both end sequences and whole genome shotgun sequence only
contigs will be indicated in the feature table.
----- Genome Center
Center: Baylor College of Medicine
Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
Contact: hgsc-help@bcm.tmc.edu
----- Project Information
Center project name: GRRR
Center clone name: CH230-64D3
----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 194955 bases at least Q40
Consensus quality: 199813 bases at least Q30
Consensus quality: 202986 bases at least Q20
Estimated insert size: 220560; sum-of-contigs estimation
Quality coverage: 4x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
consists of 1 contigs. Gaps between the contigs
are represented as runs of N. The order of the pieces
is believed to be correct as given, however the sizes
of the gaps between them are based on estimates that have
been provided by the submittor.
* This finished sequence as soon as it is available and
the accession number will be preserved.
* 1 271932: contig of 271932 bp in length.

Determining open reading frames of genome of an organism e.g. a human
 suffering from cancer involves use of single oligonucleotide primer at

PT low stringency for preparing single-stranded cDNA from mRNA of
PT individual.

PS Example 9; Page 302; 959pp; English.

XX The invention describes a method of determining open reading frames in
XX the genome of organism, comprising contacting mRNA from cell of organism
XX with a single oligonucleotide primer (I) at low stringency, preparing
XX single-stranded cDNA by reverse transcribing mRNA with (I), amplifying
XX cDNA, sequencing the product, and repeating the contacting, preparing
XX and amplifying steps with different primers and sequencing resulting
XX nucleic acids. The method is useful for: determining that a known
XX nucleotide sequence from a genome of an organism corresponds to a
XX nucleotide sequence of an open reading frame; for preparing a contig,
XX nucleic acid molecule from a genome of an organism; and for sequencing
XX all or part of a genome of an organism. mRNA is obtained from mammalian
XX or human cell which is associated with a pathological condition e.g. a
XX colon cancer or breast cancer cell. The method is useful for analyses of
XX populations of subjects and can be used to carry out genetic analyses of
XX large or small populations. further, it can be used to study living
XX systems to determine if, e.g. there have been genetic shifts which render
XX an individual or population more or less likely to be afflicted with
XX diseases such as cancer, to determine antibiotic resistance or non-
XX tolerance, and so forth. The method can also be used in the study of
XX congenital diseases, and the risk of affliction to a fetus, as well as
XX the study of whether the conditions are likely to be passed to offspring
XX through ova or sperm. The analyses for pathological conditions can be
XX carried out in all animals, plants, birds, fish, etc. Using this method,
XX in the area of agriculture, for example the genomes of food crops can be
XX studied to determine if resistance genes are present, defects in plant
XX genomes can also be studied in this way. Similarly, the method permits
XX determination of the pathogens which integrate into the genome, such as
XX retroviruses and other integrating viruses such as influenza virus, have
XX undergone shifts or mutations, which may require different approaches to
XX therapy. This method is also applied to eukaryotic pathogens, such as
XX trypanosomes, different types of plasmodium, etc. The method essentially
XX eliminates sequencing of non-coding portions. This sequence represents a
XX polynucleotide isolated from human colon cancer cell cDNA library

XX New isolated polynucleotide and encoded polypeptides, useful in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits and to assess
XX biodiversity.

PS Claim 1; SEQ ID NO 22978; 103pp; English.

XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
XX sequences. (I) is useful as hybridisation probes, polymerase chain
XX reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
XX and in recombinant production of (II). The polynucleotides are also used
XX in diagnostics as expressed sequence tags for identifying expressed
XX genes. (I) is useful in gene therapy techniques to restore normal
XX activity of (II) or to treat disease states involving (II). (II) is
XX useful for generating antibodies against it, detecting or quantitating a
XX polypeptide in tissue, as molecular weight markers and as a food
XX supplement. (II) and its binding partners are useful in treating disorders
XX of sites expressing (II). (I) and (II) are useful for treating disorders
XX involving aberrant protein expression or biological activity. The
XX polypeptide and polynucleotide sequences have applications in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits to assess biodiversity
XX and to produce other types of data and products dependent on DNA and
XX amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
XX coding sequences of the invention. Note: The sequence data for this
XX patent did not appear in the printed specification, but was obtained in

XX A method, useful for prognosing and treating solid tumor, comprises
XX comparing an expression profile of a gene expressed in peripheral blood
XX mononuclear cells to a reference expression profile of a gene.
XX Disclosure; Page; 11lpp; English.
XX The invention describes a method comprising comparing an expression
XX profile of at least one gene in a peripheral blood sample of a patient to
XX at least one reference expression profile of the at least one gene, where
XX the patient has a solid tumour, and each of the gene is differentially
XX expressed in peripheral blood mononuclear cells (PBMCs) of a first class
XX of patients as compared to PBMCs of a second class of patients, where
XX both the first and second classes of patients have the solid tumour, and
XX each of the first and second classes is a subcluster formed by an
XX unsupervised clustering analysis of gene expression profiles in PBMCs of
XX a population of patients who have the solid tumour, and where the
XX majority of the first class of patients has a first clinical outcome, and
XX the majority of the second class of patients has a second clinical
XX outcome. Also described are: a system comprising (i) a memory or a
XX storage medium including data that represent an expression profile of at
XX least one gene in a peripheral blood sample of a patient who has a solid
XX tumour, (ii) at least another storage medium including data that
XX represent at least one reference expression profile of the gene, (iii) a
XX program capable of comparing the expression profile to the reference
XX expression profile, and (iv) a processor capable of executing the
XX program, where expression levels of the gene in peripheral blood
XX mononuclear cells of patients who have the solid tumour correlate with
XX clinical outcomes of the patients; and a nucleic acid or protein array
XX comprising concentrated probes for solid tumour prognosis genes, where
XX each of the solid tumour prognosis genes is differentially expressed in
XX PBMCs of a first class of patients as compared to PBMCs of a second class
XX of patients, where both the first and second classes of patients have a
XX solid tumour, and where the first class of patients has a first clinical
XX outcome, and the second class of patients has a second clinical outcome.
XX The method, system, and array are useful for prognosing and treating
XX solid tumours. This sequence represents a solid tumour prognosis gene of
XX the invention. Note: The sequence data for this patent did not form part
XX of the printed specification, but was obtained in electronic format

XX Detecting a breast cancer-associated transcript in a patient's cell,
XX useful for diagnosing breast cancer, comprises contacting a biological
XX sample with a polynucleotide that selectively hybridizes with breast
XX cancer nucleic acids.
XX Claim 9; Page 372; 414pp; English.
XX The invention comprises a method of detecting a breast cancer-associated
XX transcript in a cell from a patient. The method of the invention involves
XX contacting a biological sample from the patient with a nucleotide that
XX hybridizes to one of the 69 breast cancer-associated gene sequences shown
XX in the specification. The method of the invention is useful in the
XX diagnosis or prognosis of breast cancer, and for detecting genes that are
XX up or down-regulated in breast cancer cells. Genes identified by the
XX method of the invention can be used in diagnostic purposes and also as
XX targets for screening for therapeutic compounds that modulate breast
XX cancer (e.g. hormones or antibodies). Identification of genes that are
XX over or under expressed in breast cancer can additionally provide high-
XX resolution, high-sensitivity datasets which can be used in the areas of
XX diagnostics, therapeutics, drug development, pharmacogenetics, protein
XX structure and biosensor development. DNA sequence AB076931, AB07761
XX represent the 69 breast cancer-associated gene sequences of the invention

 PT Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 336; 453pp; English.
 PS
 XX
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 PT Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 XX Claim 10; Page 297; 332pp; English.
 PS
 CC The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

XX KW Determining the presence or absence of a pathological cell in a patient,

XX KW useful for diagnosing, prognosing or treating cancer, comprises detecting

XX KW a nucleic acid in a biological sample.

XX PS Claim 8; SEQ ID NO 41; 1385pp; English.

XX CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

XX CC whose expression is upregulated or downregulated in specific cancers or

CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

XX KW Identifying a candidate p53 pathway-modulating agent for treating cancer
XX KW comprises contacting an assay system comprising a purified leucine rich
XX KW repeat, capricious related polypeptide or nucleic acid with a test agent.

XX PS Example 5; Page 74-75; 99pp; English.

XX CC The invention relates to a method of identifying a candidate p53 pathway

XX CC modulating agent. The method involves contacting an assay system

XX CC comprising a purified Leucine rich repeat, capricious related (LRRCAPS)

CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 PT disorders, and asthma.

Claim 16; Page 114-115; 619pp; English.

XX The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.
 CC The NOVX coding sequences and proteins are useful for treating, diabetes,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious disease, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 CC disease, immune disorders, haematopoietic disorders, cardiovascular

CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substances for use in
 CC therapeutic or diagnostic methods

 PT response useful in vaccinating against and in treating tumors.

XX Example 2; Page 78; 79pp; English.

XX The present sequence encodes the human 5T4 tumour-associated antigen
 CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 5T4 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune

CC response, preferably CTL or an antibody response in a subject

XX Identifying a candidate p53 pathway-modulating agent for treating cancer
 PT comprises contacting an assay system comprising a purified leucine rich
 PT repeat, capricious related polypeptide or nucleic acid with a test agent.

XX Disclosure; Page 75-76; 99pp; English.

XX The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

XX PT New genes regulated by MYCN activation, useful in gene therapy,
PT particularly for treating a subject with e.g. neuroblastoma or
PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.

XX PS Claim 1; SEQ ID NO 105; 27pp; English.

XX CC This invention relates to novel isolated cDNAs that are differentially
CC expressed in MYCN activated cells. Specifically, it refers to
CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an
CC exemplification of the invention. NOTE: This sequence does not appear in
CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.segdata.uspto.gov/sequence.html?DocID=20030119009.

XX PT Detecting a bladder cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT bladder cancer-associated polynucleotide or antibody.

XX PS Claim 6; Page 296; 307pp; English.

XX CC The present invention describes a method for detecting a bladder cancer-
CC associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
CC have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC The nucleic acid molecules from the present invention may be used in
CC various screening and diagnostic methods, and for gene therapy, vaccine
CC and/or antisense/inhibition applications

PT Detecting a lung cancer-associated transcript in a cell from a patient
PT for treating lung cancer, by contacting a biological sample from the
PT patient with a polynucleotide that exhibits increased or decreased
PT expression in lung cancer.
XX
XX
Claim 22; Page 335; 453pp; English.
XX
CC The invention relates to a method for detecting a lung cancer-associated
CC transcript in a cell from a patient, comprising contacting a biological
CC sample from the patient with a polynucleotide that selectively hybridises
CC to a sequence that is at least 80 % identical to a gene that exhibits
CC increased or decreased expression in lung cancer samples. Lung cancer-
CC associated polynucleotides and polypeptides are used for identifying a
CC compound that modulates a lung cancer-associated polypeptide, for
CC inhibiting proliferation of a lung cancer-associated cell to treat lung
CC cancer in a patient and for treating a mammal having lung cancer by
CC administering a modulatory compound identified. The methods are useful
CC for treating lung cancer, such as small cell lung cancer, non-small cell
CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
CC for diagnostic purposes and as targets for screening for therapeutic
CC compounds that modulate lung cancer, such as antibodies. Sequences
CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
CC invention

XX Determining the presence or absence of a pathological cell in a patient,
PT useful for diagnosing, prognosing or treating cancer, comprises detecting
PT a nucleic acid in a biological sample.

Claim 8; SEQ ID NO 39; 1385pp; English.

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,

CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

XX PT New tumor-associated antigenic target polypeptides and nucleic acids,

XX PT useful in preparing a medicament for treating or detecting a

XX PT proliferative disorder, e.g. breast, lung, colorectal, ovarian or

XX PT prostate cancer or tumor.

XX PS Claim 1; SEQ ID NO 2070; 7273pp; English.

XX CC The invention relates to human tumour-associated antigenic target (TAT)
 XX CC polypeptides, and their related nucleic acids. The TAT polypeptides are
 XX CC overexpressed in cancer tissues compared to normal tissues, and may thus
 XX CC serve as effective targets for the diagnosis and treatment of cancer in
 XX CC mammals. The invention also relates to nucleic acid and polypeptide
 XX CC sequences at least 80% identical to the TAT nucleic acids and
 XX CC polypeptides; expression vectors and host cells comprising a TAT nucleic
 XX CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
 XX CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
 XX CC TAT polypeptide; and methods and compositions for the treatment or
 XX CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
 XX CC antibodies, antagonists, binding molecules and compositions are useful
 XX CC for diagnosing or treating a cell proliferative disorder associated with
 XX CC increased TAT expression, particularly cancers such as breast cancer,
 XX CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
 XX CC cancer, pancreatic cancer, cervical cancer, cancers of the central
 XX CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
 XX CC used as hybridisation probes, in chromosome and gene mapping, in
 XX CC chromosome identification and in gene therapy. The present sequence
 XX CC represents a TAT nucleic acid of the invention

XX Identifying a compound that can treat disease or disorders, such as, a
XX neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
XX determining the expression of one or more efficacy genes in a cell
XX contacted with the test compound.
XX
XX Example 6; SEQ ID NO 174; 39pp; English.
XX
XX This invention relates to a novel screening method identified as a multi-
XX parameter high throughput screening (MPHTS) assay. Specifically, it
XX refers to an assay that utilizes the disease signature of a plurality of
XX specific genes associated with a particular disease, and identifies
XX differential expression between those cells taken from individuals
XX affected by that disease and those that are not affected. The present
XX invention then describes the screening of candidate pharmaceutical
XX compounds to identify those that have a potential therapeutic benefit for
XX the treatment of neuropsychiatric and neurodegenerative disorders
XX including schizophrenia, bipolar affective disorder (BAD) and autism, as
XX well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
XX of this invention exhibit various activities including neuroleptic,
XX nootropic, antimanic and antidepressant. Furthermore, the screening
XX method used in MPHTS will be automated, such that a large number of test
XX compounds may be rapidly screened with a minimal amount of labour and
XX effort. This polynucleotide is a human cDNA sequence of a gene that is
XX differentially expressed in the presence of a therapeutic compound and
XX represents an exemplary efficacy gene for bipolar affective disorder,
XX given in an exemplification of the invention.

XX New isolated polynucleotide and encoded polypeptides, useful in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits and to assess
XX biodiversity.
XX Claim 1; SEQ ID NO 22979; 103pp; English.
XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
XX sequences. (I) is useful as hybridisation probes, polymerase chain
XX reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
XX and in recombinant production of (II). The polynucleotides are also used
XX in diagnostics as expressed sequence tags for identifying expressed
XX genes. (I) is useful in gene therapy techniques to restore normal
XX activity of (II) or to treat disease states involving (II). (II) is
XX useful for generating antibodies against it, detecting or quantitating a
XX polypeptide in tissue, as molecular weight markers and as a food
XX supplement. (II) and its binding partners are useful in medical imaging
XX of sites expressing (II). (I) and (II) are useful for treating disorders
XX involving aberrant protein expression or biological activity. The
XX polypeptide and polynucleotide sequences have applications in
XX diagnostics, forensics, gene mapping, identification of mutations
XX responsible for genetic disorders or other traits to assess biodiversity
XX and to produce other types of data and products dependent on DNA and
XX amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
XX coding sequences of the invention. Note: The sequence data for this

XX New signal transducer and activator of transcription 6 activation
XX promoting purified protein, for diagnosing and treating disease
XX associated with activation/inhibition of transcription factor e.g.
XX diabetes and cancer.
XX Claim 4; SEQ ID NO 127; 1368pp; English.
XX The invention relates to a purified protein promoting signal transducer
XX and activator of transcription 6 activation (STAT6). The protein is
XX useful for the producing an antibody, which involves administering the
XX protein or its epitope-bearing fragments to a non-human animal as an
XX antigen. The nucleic acid is useful for diagnosing a disease or
XX susceptibility to a disease related to expression or activity of the
XX protein. A transformant expressing the protein is useful for screening
XX compounds which inhibit or promote STAT6 activation. A transformant
XX expressing the protein is useful for producing a pharmaceutical
XX composition. Compositions, antibodies and antisense molecules are useful
XX for the treating a disease associated with STAT6 activation such as
XX allergic diseases, inflammation, autoimmune diseases, diabetes,
XX hyperlipidaemia, infections disease and cancers. Compositions are useful
XX for treating disease associated with STAT6 activation and/or prevention
XX of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
XX arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
XX allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
XX viral hepatitis and AIDS. The protein has efficiently promoting STAT6
XX activity. The protein or nucleic acid is effectively useful for screening
XX compounds for treating and preventing disease associated with excessive
XX activation or inhibition of STAT6. The present sequence represents a
XX human cDNA encoding a protein which promotes STAT6 activation.

 DR
 XX New oligonucleotide primers (830 cDNAs) useful for synthesizing full
 PT length human cDNAs.
 XX
 XX Example 1; SEQ ID NO 2866; 1340pp; English.
 PS
 XX This invention relates to a novel primers useful for synthesising full
 CC length cDNA molecules that encode human proteins. Specifically, it refers
 CC to secretory or membrane proteins that are potential therapeutic agents/
 CC target molecules in the field of medicine, and in particular genes
 CC encoding proteins that are associated with signal transduction,
 CC glycoproteins and transcription. The present invention describes a method
 CC for efficiently cloning a full length human cDNA from both the 5' and 3'
 CC ends using the oligo-capping method. This polynucleotide sequence is a
 CC full length human cDNA clone of the invention.

 DR
 XX Identifying a compound that inhibits the activity of a protein for
 PT Drosophila viability for use e.g., as insecticidal agent by expressing in
 PT a recombinant host a DNA molecule to produce a protein essential for
 PT Drosophila viability.
 XX
 XX Claim 1; SEQ ID NO 186; 57pp; English.
 PS
 XX The present invention relates to a method for identifying a compound that
 CC inhibits the activity of a protein essential for Drosophila viability.
 CC The method comprises: (a) expressing in a recombinant host a DNA sequence
 CC encoding a protein essential for Drosophila viability; (b) testing
 CC compounds suspected of having the ability to inhibit the activity of the
 CC protein expressed in (a); and identifying a compound tested in (b) that
 CC inhibits the activity of the protein. The method is useful in identifying
 CC a compound that inhibits the activity of a protein essential for
 CC Drosophila viability for use as insecticidal, ectoparasiticide,
 CC antiparasitic, antihelminthic or acaricidal agent. The present sequence
 CC is the DNA sequence for one such protein essential for Drosophila
 CC viability. Note: The sequence data for this patent did not form part of
 CC the printed specification, but was obtained in electronic format directly
 CC from WIPO at ftp.wipo.int/pub/published_pct_sequences.

XX PS Claim 4; Page 68; 68pp; English.

XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 574, and the
 CC polynucleotide sequences encoding them. The 574 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 574 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 574
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 574 protein

XX PT New major histocompatibility complex class I peptide epitopes from human
 PT 574 tumor-associated antigen, useful for preventing and/or treating a
 PT disease, particularly cancer.

XX PS Disclosure; Page 67; 73pp; English.

XX The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 574 antigen. The invention further
 CC provides a polypeptide string comprising the 574 epitope; a nucleic acid
 CC sequence encoding the 574 epitope or a polypeptide string of the 574
 CC epitope; a vector system capable of delivering the 574 epitope nucleic
 CC acid to a cell; a cell pulsed with the 574 epitope; a polypeptide of the
 CC 574 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 574 epitope and/or its encoding nucleic acid; a method
 CC comprising detecting the presence of the 574 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 574 epitope in conjunction with an MHC class
 CC I molecule. The 574 epitope has cytostatic activity. The vaccine
 CC comprising the 574 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 574 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline

 XX
 CC The invention relates to a purified nucleic acid molecule associated with
 CC lactation or muscle and fat deposition (designated LMPD), derived from
 CC cattle, and the LMPD nucleic acid can specifically hybridise to a second
 CC nucleic acid molecule comprising any of 15112 nucleotide sequences,
 CC appearing as ABX34836-ABX49947, or complements of them. Also included are
 CC ; (1) a transformed cell having a nucleic acid comprising an LMPD nucleic
 CC acid linked to a promoter and a 3' non-translated sequence that
 CC functions in the cell to cause termination of transcription and addition
 CC of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
 CC (2) determining a level or pattern of a molecule in a bovine cell or
 CC tissue comprising: (a) incubating a marker nucleic acid (comprising any
 CC of the 15112 nucleic acid sequences or its complement or fragment) with a
 CC complementary nucleic acid molecule obtained from the bovine cell or
 CC tissue, where hybridisation between the marker nucleic acid and the
 CC complementary nucleic acid permits the detection of the molecule; and (b)
 CC detecting the level or pattern of the complementary nucleic acid, where
 CC the detection of the complementary nucleic acid is predictive of the
 CC level or pattern of the molecule. The LMPD nucleic acid is used for
 CC determining a level or pattern of a molecule in a bovine cell or tissue.
 CC It is useful for genome mapping, gene identification and analysis, or
 CC breeding, preparation of constructs for use in cattle gene expression, or
 CC for genetically improving cattle. The present sequence is one of the
 CC 15112 bovine LMPD EST (expressed sequence tag) nucleic acids. Note: The
 CC present sequence was not shown in the specification but was obtained in
 CC electronic format from the USPTO web site:

XX Nucleic acids encoding 4277 human colon cancer-associated polypeptides,
XX useful for preventing, diagnosing and/or treating colorectal cancers.

XX Claim 1; Page 5353-5354; 9803pp; English.

XX AAH32943 to AAH37195 and AAG77788 represent human colon
XX cancer-associated nucleic acid molecules (N) and proteins (P), where the
XX proteins are collectively known as colon cancer antigens. The colon
XX cancer antigens have cytostatic activity and can be used in gene therapy
XX and vaccine production. N and P may be used in the prevention, diagnosis
XX and treatment of diseases associated with inappropriate P expression. For
XX example, N and P may be used to treat disorders associated with decreased
XX expression by rectifying mutations or deletions in a patient's genome
XX that affect the activity of P by expressing inactive proteins or to
XX supplement the patient's own production of P. Additionally, N may be used
XX to produce the colon cancer-associated P, by inserting the nucleic acids
XX into a host cell and culturing the cell to express the proteins. N and P
XX can be used in the prevention, diagnosis and treatment of colorectal
XX carcinomas and cancers. AAH37196 to AAH37204 and AAG77789 represent

CC sequences used in the exemplification of the present invention. N.B.

XX New polynucleotide sequences obtained from various cDNA libraries, useful
XX as hybridization probes, as oligomers for PCR, for chromosome and gene
XX mapping, in the recombinant production of protein, or in generating
XX antisense DNA or RNA.

XX Claim 1; SEQ ID NO 32690; 44pp; English.

XX The invention relates to an isolated polynucleotide comprising any one of
XX 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was
XX determined by the technique of SBH (sequencing by hybridisation). Also
XX included is a purified polypeptide comprising a sequence corresponding to
XX a reading frame of the novel polynucleotide. The nucleic acid sequences
XX are useful in diagnostics as expressed sequence tags (EST) for
XX identifying expressed genes or for physical mapping of the human genome,
XX in forensics, in assessing biodiversity, or in identifying mutations
XX responsible for genetic disorders and other traits. The nucleotide
XX sequences are also useful as hybridisation probes, as oligomers for PCR,
XX for chromosome and gene mapping, in the recombinant production of
XX protein, or in generating antisense DNA or RNA. The purified polypeptide

CC is useful for generating antibodies specific for it. The present sequence
CC is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data
CC for this patent did not form part of the printed specification, but was
CC obtained in electronic format directly from USPTO at
CC seqdata.uspto.gov/sequence.html?DocID=20030073623

XX PT New human genome-derived single exon nucleic acid probes useful for human
XX gene expression analysis, for identifying or characterizing alternative
XX splicing events, for assessing genomic alterations or as tools for
XX surveying tissues.

XX PS Claim 15; SEQ ID NO 7785; 80pp; English.

XX CC The invention relates to a nucleic acid probe for measuring human gene
XX expression, comprising any of the 27,400 fully defined nucleotide
XX sequences in the specification, or their complements or fragments, and
XX encoding at least 8 amino acids of any of the 6888 amino acid sequences
XX fully defined in the specification. The probe is a single exon probe that
XX hybridises under high stringency conditions to a nucleic acid molecule
XX expressed in human cells or tissues. Also included are a spatially-
XX addressable set of single exon nucleic acid probes for measuring human
XX gene expression (comprising a plurality of single exon nucleic acid
XX probes cited above, where each of the plurality of probes is separately
XX and addressably isolatable or amplifiable from the plurality), a single
XX exon microarray for measuring human gene expression, a method of
XX measuring human gene expression, a vector comprising the single exon

CC probe cited above, an ORF-encoded peptide comprising at least 8
CC contiguous amino acids of any of the above-mentioned amino acid
CC sequences (optionally with conservative amino acid substitutions), an
CC isolated antibody that binds specifically to a peptide cited above,
CC methods of selling and/or licensing single exon probes or microarrays to
CC a customer desiring to measure gene expression, a method of providing
CC human gene expression data by subsequence, and a computer-readable
CC storage medium which contains a database having a plurality of records
CC (each record including data on the expression of a single exon probe
CC cited above. The probe, methods and apparatus are useful in gene
CC expression analysis. The probes may be used as tools for surveying
CC tissues to detect the presence of expressed messages that contain their
CC specific exon, or in constructing genome-derived single exon microarrays.
CC In addition, the probes are used in identifying and characterising
CC alternative splicing events, in detecting and characterising gross
CC alterations in the genomic locus that includes their exon, in assessing
CC smaller genomic alterations, in priming the synthesis of nucleic acids,
CC or in expressing the ORF-encoded peptide. The present sequence is a human
CC single exon probe of the invention. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from USPTO at
CC seqdata.uspto.gov/sequence.html?DocID=20030194704

XX Isolated polypeptide for directing secretion of proteins of interest from a host cell including, e.g. bacteria, includes contiguous amino acid residues of polypeptide with specified amino acids.

PS Claim 9; Page 231-233; 617pp; English.

XX AAH52093 to AAH52303 encode the human secreted proteins given in AAG81242 to AAG81453. The secreted proteins can be used for directing the secretion of proteins of interest from a host cell including bacteria, fungal cells, and cultured higher eukaryotic cells. The present invention also describes fusion proteins, where a secreted protein of the invention

CC is operably linked via a peptide bond or peptide linker to a second
 CC protein selected from the group consisting of maltose binding protein, an
 CC immunoglobulin constant region, a polynitidine tag and a peptide given
 CC in AAG81453

PT New nucleic acid molecule and encoded polypeptide, for diagnosing,
 PT preventing or treating cell proliferative disorders such as cancer.

PS Claim 1; SEQ ID NO 3919; 5504pp; English.

CC The present invention describes an isolated tumour-associated antigenic
 CC target (TAT) nucleic acid comprising: (a) any of 4622 nucleotide
 CC sequences (see SEQ ID NO:1 to 4622); (b) the full-length coding region of
 CC (a); (c) the complement of (a) or (b); (d) a sequence that has 80%
 CC sequence identity to (a)-(c); or (e) a sequence that hybridises to (a)-
 CC (c). Also described: (1) an expression vector comprising the above
 CC nucleic acid; (2) a host cell comprising the above expression vector; (3)
 CC a process for producing a polypeptide; (4) an isolated polypeptide
 CC comprising: (a) an amino acid sequence encoded by any of the above
 CC nucleotide sequences; (b) an amino acid sequence encoded by the full-
 CC length coding region of the above nucleotide sequences; or (c) a sequence
 CC having at least 80% identical to (a) or (b); (5) a chimeric polypeptide
 CC comprising the above polypeptide fused to a heterologous polypeptide; (6)
 CC an isolated antibody that binds to the above polypeptide; (7) a process
 CC for producing the antibody; (8) an isolated oligopeptide that binds to
 CC the above polypeptide; (9) a tumour-associated antigenic target (TAT)

CC binding organic molecule that binds to the above polypeptide; (10) a
 CC composition of matter comprising the above (chimeric) polypeptide,
 CC antibody, oligopeptide or TAT binding organic molecule, in combination
 CC with a carrier; (11) an article of manufacture comprising a container and
 CC the composition of matter contained within the container; (12) methods of
 CC inhibiting the growth of a cell that expresses the above protein, where
 CC the growth of the cell is at least in part dependent upon a growth
 CC potentiating effect of the above protein; (13) a method of
 CC therapeutically treating a mammal having a cancerous tumour comprising
 CC cells that express the above protein; (14) a method of determining the
 CC presence of a protein in a sample suspected of containing the protein
 CC described above; (15) methods of diagnosing the presence of a tumour in a
 CC mammal; (16) a method for treating or preventing a cell proliferative
 CC disorder associated with increased expression or activity of the above
 CC protein; and (17) a method of binding an antibody, oligopeptide or
 CC organic molecule to a cell that expresses the protein described above.
 CC The TAT sequences have cytostatic activities, and can be used in gene
 CC therapy. The composition and methods are useful for diagnosing,
 CC preventing or treating cancer. The composition is also used for preparing
 CC a medicament for the therapeutic treatment or diagnostic detection of a
 CC cell proliferative disorder or cancer. The present sequence represents a
 CC human TAT cDNA sequence from the present invention.

1 (bases 1 to 121909)
Garner, P.
Direct Submission
Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vegas@sanger.ac.uk
Clone requests: clonerequest@sanger.ac.uk
On Dec 15, 2000 this sequence version replaced gi:11558491.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em: ENBL; Sw: SWISSPROT; Tr: TREMBL; Wp: WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
Group. Further information can be found at

```

<http://www.sanger.ac.uk/HGP/Chr6>
 RP3-492P14 is from the library RPCI-3 constructed by the group of
 Pieter de Jong. For further details see
<http://www.chori.org/bacpac/home.htm>
 VECTOR: pCYPAC2

----- Genome Center
 Center: Wellcome Trust Sanger Institute
 Center code: SC
 Web site: <http://www.sanger.ac.uk>
 Contact: vega@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all
 regions were either double-stranded or sequenced with an alternate
 chemistry or covered by high quality data (i.e., phred quality >=
 30); an attempt was made to resolve all sequencing problems, such
 as compressions and repeats; all regions were covered by at least
 one subclone; and the assembly was confirmed by restriction digest,
 except on the rare occasion of the clone being a YAC.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em, EMBL; Sw, SWISSPROT; Tr, TrEMBL; Wp, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/c_elegans/wormpep Clone-derived zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be submitted.

Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'dr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml

DR5YP-123H10 is from a Zebrafish BAC library

Sequencing vector: M13, M77815; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 181761 bases at least Q40
Consensus quality: 186033 bases at least Q30
Consensus quality: 187976 bases at least Q20

Insert size: 188000; agarose-fp
Insert size: 190759; sum-of-contigs
Quality coverage: 4.8 in Q20 bases; agarose-fp
Quality coverage: 4.7 in Q20 bases; sum-of-contigs

* NOTE: This is a 'working draft' sequence. It currently
* consists of 13 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

```

```

more than one ml3 subclone.

For a graphical representation of this clone sequence and its analysis see:
http://www.wormbase.org/db/seq/sequence?name=ZC132;class=Sequence

NEIGHBORING CLONE INFORMATION

The 5' clone is F47D2, 200 bp overlap; the 3' clone is R02D1, 950 bp overlap. Actual start of this clone is at base position 29759 of F47D2; actual end is at 24950 of ZC132.

NOTES:

Coding sequences below are the result of integration and manual review of the following data : computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CS_INDEX.html) and The C. elegans ORFome cloning project (http://wofdb.dfc.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans researchers. TRNAs are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).
